PT Compound for inhibiting the expression of protein phosphatase 1B (PTP1B)
PT and for treating diabetes, cancer, or obesity, comprises an antisense
PT oligonucleotide targeted to nucleic acid encoding PTP1B.
XX
PS Claim 3; Page 24; 133pp; English.
XX
CC The invention relates to a compound of 8-50 nucleobases in length
CC targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where
CC the compound specifically hybridises with and inhibits the expression of
CC PTP1B (e.g. an antisense oligonucleotide). Also included are (1) a
CC compound of 8-50 nucleobases in length which specifically hybridises with
CC an 8 nucleobase portion of an active site on a nucleic acid encoding
CC PTP1B; (2) inhibiting the expression of PTP1B in cells or tissues
CC comprising contacting the cells or tissues with the compound; treating an
CC animal having or suspected of having a disease or condition associated
CC with PTP1B comprising administering the compound; (4) decreasing blood
CC sugar levels in an animal comprising administering the compound; (5)
CC preventing or delaying the onset of a disease or condition associated
CC with PTP1B in an animal comprising administering the compound; and (6)
CC preventing or delaying the onset of an increase in blood glucose levels
CC in an animal comprising administering the compound. The compound is used
CC to inhibit the expression of PTP1B in cells or tissues, to treat or
CC prevent or delay the onset of a disease or condition associated with
CC PTP1B, such as type 2 diabetes, obesity, cancer (especially ovarian
CC cancer, chronic myeloid leukaemia and hyperproliferative diseases in an
CC animal having or suspected of having the disease or condition, and for
CC decreasing blood sugar levels or preventing or delaying the onset of an
CC increase in blood glucose levels in an animal. The compound is also used
CC in diagnostics, therapeutics, prophylaxis, and in research reagents and
CC kits. The present sequence is an antisense compound of the invention
CC targetting rat PTP1B

PT   New antisense oligonucleotides that modulate (particularly inhibit) human
PT   hepsin, useful for treating a disease or condition associated with the
PT   expression of hepsin, e.g. inflammation or tumor growth.
XX
PS   Example 15; Page 83; 101pp; English.
XX
CC   The invention relates to an antisense compound 8-30 nucleobases in length
CC   targetted to a nucleic acid molecule encoding human hepsin. The antisense
CC   compound specifically hybridises with and inhibits the expression of
CC   human hepsin. The antisense compound or the pharmaceutical composition is
CC   useful for treating animals and humans having a disease or condition
CC   associated with the expression of hepsin, e.g. inflammation or tumour
CC   growth. The antisense compounds are useful also for diagnostics,
CC   prophylaxis (e.g. to prevent or delay infection, inflammation or tumour
CC   formation) or as research reagents and kits. The method is useful for
CC   modulating, specifically inhibiting the expression of hepsin which may be
CC   used in research, e.g to distinguish between functions of various members
CC   of a biological pathway. The invention is used in gene therapy. The
CC   present sequence is human hepsin antisense oligonucleotide

PT   Novel antisense compound useful for treating type 2 diabetes, cancer and
PT   obesity, is targeted to nucleic acid encoding human protein phosphatase
PT   1B, and hybridizes and inhibits PTP1B expression.
XX
PS   Claim 3; Page 72; 142pp; English.
XX
CC   The invention relates to a compound targeted to a nucleic acid molecule
CC   encoding protein phosphatase 1B (PTP1B), which specifically hybridises
CC   with and inhibits the expression of PTP1B. The compounds of the invention
CC   are useful for inhibiting the expression of PTP1B in liver, kidney or
CC   adipose cells or tissues and for treating an animal, preferably human,
CC   having a disease or condition associated with PTP1B, including metabolic
CC   diseases or conditions, e.g. type 2 diabetes and obesity, or
CC   hyperproliferative conditions such as cancer. The sequences are also
CC   useful for decreasing blood (serum or plasma) glucose levels in an animal
CC   e.g. a diabetic human or rodent, for preventing or delaying the onset of
CC   a disease or condition associated with PTP1B , and for preventing or
CC   delaying the onset of an increase in blood glucose levels. This sequence
CC   represents a PTP1B mRNA level inhibition antisense oligonucleotide of the
CC   invention

PT   Activating a dendritic cell for cancer immunotherapy or for treating
PT   infectious or allergy disease, by contacting a dendritic cell with an
PT   isolated nucleic acid containing at least one unmethylated CpG
PT   dinucleotide.
XX
PS   Example 6; Col 34; 52pp; English.
XX
CC   This invention relates to a novel method for activating or causing
CC   maturation of a dendritic cell. The method comprises contacting a
CC   dendritic cell with an isolated nucleic acid containing at least one
CC   unmethylated CpG dinucleotide in an amount effective to activate or cause
CC   maturation of the dendritic cell, where the activation is performed ex
CC   vivo. The method of the invention may have cytostatic or antiallergic
CC   activities. The method of the invention is useful for cancer
CC   immunotherapy or for treating an infectious disease or allergy, by
CC   administering an activated dendritic cell that express a specific cancer,
CC   microbial or allergy causing antigen, to a subject having a cancer
CC   including the cancer antigen, to a subject having an infection with a
CC   microorganism including the microbial antigen or to a subject having an
CC   allergic reaction to the allergy causing antigen, where the activated
CC   dendritic cell is prepared using the method of the invention. The method
CC   is useful for generating a high yield of dendritic cells by administering
CC   an isolated nucleic acid containing at least one unmethylated CpG
CC   dinucleotide, where the nucleic acid is 8-80 bases in length in an amount
CC   effective to activate the dendritic cells to a subject, and isolating
CC   dendritic cells from the subject. The use of CpG allows the generation of
CC   mature dendritic cells from peripheral blood within two days in a well
CC   defined system. The application of CpG for this purpose is superior to
CC   granulocyte macrophage-colony stimulating factor (GM-CSF), which is
CC   currently used for this purpose. CpG oligonucleotides have a longer half
CC   life, are less expensive, and show a greater magnitude of immune effects.
CC   The present sequence represents a CpG oligonucleotide used in the method
CC   of the invention

PT   Designing capture oligonucleotide probes for use on a support to which
PT   complementary oligonucleotides hybridize with little mismatch.
XX
PS   Example 5; Fig 29; 300pp; English.
XX
CC   The present invention describes a method (M1) for designing capture
CC   oligonucleotide probes (I) for use on a support to which complementary
CC   oligonucleotide probes (II) will hybridise with little mismatch, where
CC   (I) have melting temperatures within a narrow range. The method is useful
CC   for detecting infectious diseases caused by bacterial infectious agents
CC   e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal
CC   infectious agents e.g. Cryptococcus neoformans, Candida albicans and
CC   Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus,
CC   Epstein-Barr virus and polio virus, and parasitic infectious agents
CC   selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus
CC   medinesis. The method is also useful for detecting genetic diseases such
CC   as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
CC   Detecting cancer involving oncogenes, tumour suppressor genes, or genes
CC   involved in DNA amplification, replication, recombination or repair, the
CC   cancer is specifically associated with a gene selected from BRCA1 gene,
CC   p53 gene, human papillomavirus types 16 and 18 and liver cancers. The
CC   method is also used for environmental monitoring, forensics and the food
CC   and feed industry, detecting comprises scanning (using e.g. a scanning
CC   electron microscope and infrared microscope) the support at the
CC   particular sites and identifying if ligation of the oligonucleotide probe
CC   sets occurred and correlating (using a computer) identified ligation to a
CC   presence or absence of the target nucleotide sequences. ABI82074 to
CC   ABI97546 represent oligonucleotide sequences used in the exemplification
CC   of the present invention

PT   Nucleic acids having higher expression in human neuroblastoma with poor
PT   prognosis for diagnostic prediction of neuroblastoma prognosis.
XX
PS   Example 5; Page 28; 111pp; Japanese.
XX
CC   The invention comprises nucleic acids that show increased expression in
CC   human neuroblastomas with poor prognosis over those with a good
CC   prognosis. The nucleic acids of the invention are useful as a tool for
CC   distinguishing neuroblastomas with a favourable prognosis (spontaneous
CC   regression) from neuroblastomas with a poor prognosis (high malignancy).
CC   The DNA sequences ABT32224 - ABT32571 represent oligonucleotides used in
CC   an example of the invention

CC The invention comprises oligonucleotides for detecting bacteria, the
CC oligonucleotides contain a gene sequence of a spacer region between genes
CC encoding 16S rRNA and 23S rRNA of Pediococcus dextrinicus, P. parvulus,
CC P. acidilactici or P. pentosaceus. The oligonucleotides of the invention
CC are useful as primers for detecting P. dextrinicus, P. parvulus, P.
CC acidilactici and P. pentosaceus, in beer brewery and in fermented-food
CC preparation process. The present DNA sequence represents a detection PCR
CC primer of the invention.

PT Activating a dendritic cell useful for treating cancer, infectious
PT diseases or allergies, comprises contacting the dendritic cell with an
PT amount of an isolated nucleic acid that contains at least one
PT unmethylated CpG dinucleotide.
XX
PS Disclosure; Page 11; 51pp; English.
XX
CC The invention relates to a method of activating a dendritic cell. The
CC method involves contacting the dendritic cell with an isolated nucleic
CC acid containing at least one unmethylated CpG dinucleotide, where the
CC nucleic acid is about 8-80 bases in length, in an amount that activates
CC the dendritic cell. The compositions and methods of the invention are
CC useful for cancer immunotherapy, or for treating an infectious disease
CC (e.g. viral, bacterial or fungal infections) or allergy. The invention is
CC useful in cell therapy. The present sequence is an oligonucleotide used
CC for activating dendritic cells

PT Predicting potential of oligonucleotides to hybridize to target
PT nucleotide sequence comprises determining and evaluating for each
PT oligonucleotide a parameter predictive of the oligonucleotides ability to
PT hybridize with target.
XX
PS Example 2; SEQ ID NO 354; 423pp; English.
XX
CC The invention relates to a method of predicting the potential of
CC oligonucleotides to hybridise to target nucleotide sequences. The method
CC is useful for predicting the potential of an oligonucleotide to hybridise
CC to a target nucleotide sequence, e.g. RNA or DNA or a sequence that
CC contains chemically modified nucleotides. The method is also useful for
CC predicting the potential of the oligonucleotides to hybridise to a
CC complementary target nucleotide sequence. The method is useful to predict
CC efficient hybridisation oligonucleotides for each of multiple target
CC sequences therefore very large arrays may be constructed and tested with
CC minimum synthesis of oligonucleotides. The present sequence represents a
CC HIV PRT antisense derived probe.

PT   New NOVX polypeptides and nucleic acids, useful for preventing or
PT   treating NOVX-associated disorders, e.g. cancer, cardiomyopathy,
PT   atherosclerosis or diabetes, and in chromosome mapping, tissue typing or
PT   pharmacogenomics.
XX
PS   Example B; SEQ ID NO 169; 211pp; English.
XX
CC   This invention relates to novel NOVX proteins, and the DNA sequence which
CC   encode them, having properties related to stimulation of biochemical or
CC   physiological responses in a cell, a tissue, an organ or an organism.
CC   Compounds which modulate the proteins of the invention may have cardiant,
CC   antiarteriosclerotic, hypotensive, cytostatic, anorectic, antirheumatic,
CC   antiarthritic, antidiabetic, nephrotropic, dermatological,
CC   immunosuppressive, anti-HIV, antiinflammatory, neuroprotective,
CC   nootropic, antipsoriatic, antiparkinsonian, antiasthmatic, neuroleptic,
CC   antidepressant, antiallergic or gynaecological activities. The DNA
CC   sequences of the invention may be useful for gene therapy whilst the
CC   protein sequences may allow the development of a vaccine. The protein is
CC   useful in the manufacture of a medicament for treating a syndrome
CC   associated with a human disease. The invention may be useful in
CC   diagnosing, treating or preventing NOVX-associated disorders, for example
CC   cardiomyopathy, atherosclerosis, hypertension, cancer, obesity,
CC   rheumatoid arthritis, diabetes, glomerulonephritis, psoriasis, skin
CC   disorders, AIDS, inflammation, multiple sclerosis, Alzheimer's disease,
CC   Parkinson's disease, asthma, schizophrenia, depression, allergies or
CC   fertility disorders. The nucleic acids may further be used as
CC   hybridisation probes, in chromosome mapping, tissue typing, preventive
CC   medicine, and pharmacogenomics. The present sequence is that of PCR
CC   primer Ag5928 reverse which was used for the amplification of a human
CC   gene sequence during the analysis of gene expression in the
CC   exemplification of the invention.

XX
PT   Detection of chromosomal abnormalities e.g. Down's Syndrome, non-
PT   invasively in a fetus, comprises forming a ratio of amounts of alleles at
PT   a locus of interest and a different heterozygous locus.
XX
```

```
PS   Example 7; Page 164; 164pp; English.
XX
CC   This invention relates to a novel method of detecting chromosomal
CC   abnormalities by determining the sequence of alleles of a locus of
CC   interest from template DNA, determining which alleles are present and
CC   comparing to amounts of alleles at a different, selected heterozygous
CC   locus (for example on another chromosome or a maternal locus); relative
CC   amounts are expressed as a ratio indicating presence or absence of the
CC   abnormality. The method is useful for the detection of genetic disorders,
CC   especially in a foetus, including chromosomal abnormalities and
CC   mutations, for example translocations, transversions, monosomies,
CC   trisomies (for example trisomy 21 in which an additional copy of
CC   chromosome 21 results in Down's Syndrome) and other anueoplodies,
CC   deletions, additions, amplifications, translocations and rearrangements.
CC   It can be used to detect any alterations in a gene sequence, especially
CC   single nucleotide polymorphisms (SNPs), and may be used to detect
CC   numerous abnormalities simultaneously, for example if several SNPs are
CC   associated with a particular disease. The method provides a rapid, non-
CC   invasive method for determining the sequence of DNA from a foetus using a
CC   sample from a pregnant female, for example to detect genetic disorders as
CC   above or to determine if a foetus is a carrier of a disease or
CC   predisposed to a disease.

PT   Determining a sequence of a locus of interest comprises replicating a
PT   region of DNA comprising a locus of interest from a template
PT   polynucleotide by using a first and a second primer.
XX
PS   Example 5; Page 141; 190pp; English.
XX
CC   The invention relates to a novel method for determining the sequence of a
CC   locus of interest which comprises replicating a region of DNA comprising
CC   a locus of interest from a template polynucleotide by using a first and a
CC   second primer where the second primer contains a sequence that generates
CC   a recognition site for a restriction enzyme such that digestion with the
CC   restriction enzyme generates a 5' overhang containing the locus of
CC   interest. The method may be useful for determining the sequences of
CC   multiple loci of interest concurrently and for determining the sequence
CC   of a mutant allele in the presence of a normal allele. The current
CC   sequence is that of the human APC (adenomatous polyposis coli) DNA
CC   fragment of the invention which is located on chromosome 5q21-22 and in
CC   which mutations are associated with colorectal cancer.

PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Disclosure; SEQ ID NO 6216; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO

PT   New nucleic acid sequence comprising DPP10 mRNA, useful for the
PT   manufacture of a medicament for regulating DPP10 protein expression or
PT   for preventing or treating inflammatory disease e.g., inflammatory bowel
PT   disease.
XX
PS   Disclosure; Page 321; 321pp; English.
XX
CC   The present invention describes a new isolated nucleic acid sequence (I)
CC   comprising a DPP10 mRNA sequence. DPP10 is a dipeptidyl peptidase (also
CC   known as prolyloligopeptidase). (I) has antiinflammatory, antiasthmatic,
CC   antipsoriatic, antiarthritic and antirheumatic activities, and can be
CC   used in vaccines and gene therapy. A composition comprising (I) can be
CC   used for the manufacture of a medicament for regulating DPP10 expression
CC   or for preventing or treating inflammatory disease e.g., inflammatory
CC   bowel disease, asthma, atopy, rheumatoid arthritis or psoriasis. (I) can
CC   also be used in an assay for detecting or measuring DPP10 in a sample. A
CC   host cell comprising (I) can be used for producing recombinant DPP10 gene
CC   products, or in drug screening systems to identify agents for diagnosis
CC   or treatment of individuals having or susceptible to inflammatory
CC   disease. Human DPP10 is located on chromosome 2, more specifically
CC   chromosome 2q14. ABQ84254 to ABQ84612 and ABP55569 to ABP55629 represent
CC   sequences used in the exemplification of the present invention

XX
CC   The present invention describes polypeptides (I) and their amides, esters
CC   and salts which bind to the human G protein-coupled receptor (GPCR)
CC   proteins TGR23-1 and TGR23-2. TGR23 proteins have anorectic and
CC   cytostatic activities. (I) can be used in the treatment, prevention and
CC   diagnosis of obesity disorders and cancer (including cancer of the
CC   intestines, colon, breast, lung (including non-small cell lung cancer),
CC   prostate, oesophagus, stomach, liver, pancreas, kidney, womb, ovary,
CC   testis, bladder and brain, and blood cancers). (I) can also be used in
CC   appetite stimulation. ACC68807 to ACC68890 and ABP97241 to ABP97280

PT   New TbD1 nucleic acids having the mutation CTG to CGG at codon 463 of
PT   gene katG, useful for distinguishing Mycobacterium tuberculosis infection
PT   from M. africanum, M. canetti, M. microti, M. bovis, or M. bovis BCG
PT   infection.
XX
PS   Disclosure; Page 20; 73pp; English.
XX
CC   The invention relates to a novel isolated or purified nucleic acid. A
CC   polypeptide encoded by a nucleic acid of the invention has antibacterial
CC   activity, and may have a use in a vaccine. The nucleic acid is a TbD1
CC   nucleic acid having a fully defined sequence of 3953 bp given in the
CC   specification. The TbD1 deletion or mmpL6 551 polymorphism is useful as a
CC   genetic marker for the differentiation of Mycobacterium strain of M.
CC   tuberculosis complex. The genetic marker in association with at least one
CC   genetic markers selected from RD1, RD2, RD3, RD4, RD5, RD6, RD7, RD8,
CC   RD9, RD10, Rd11, RD13, RD14, RvD1, RvD2, RvD3, RvD4, RvD5, katG463 ,
CC   gyrA95 , oxyR'285 , and pncA57, may be used for the differentiation of
CC   Mycobacterium strain of M. tuberculosis complex. The nucleic acids may
CC   also be used to distinguish an infection resulting from M. tuberculosis
CC   from an infection resulting from M. africanum, M. canetti, M. microti, M.
CC   bovis, M. bovis BCG. The present sequence is used in the exemplification
CC   of the invention.

PT Pharmaceutical composition for treating asthma, has antisense
PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and
PT bronchodilating agent.
XX
PS Claim 15; SEQ ID NO 6869; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

PT   New isolated nucleic acid or alternate splice variant, useful for
PT   diagnosing and treating a disintegrin and metalloprotease (ADAM) or
PT   interactor gene-associated disorder, e.g. asthma, atopy, obesity or
PT   inflammatory bowel disease.
XX
PS   Claim 2; Page 128; 338pp; English.
XX
CC   The invention relates to an isolated nucleic acid or alternate splice
CC   variant comprising a nucleotide sequence containing at least one of the
CC   single nucleotide polymorphisms given in the specification, a nucleotide
CC   sequence having at least 15 contiguous nucleotides of them, or
CC   complements of them. The genes are ADAM19 (a disintegrin and
CC   metalloprotease 19, also known as gene 845), NRG2 (neuroregulin 2, also
CC   known as gene 847), endophilin 1 (also known as gene 874), endophilin 2
CC   (also known as gene 803) and ADAMTS2 (a disintegrin and metalloprotease
CC   with thrombospondin type1 motif 2, also known as gene 962). Also included
CC   are a vector comprising the isolated nucleic acid (or alternate splice
CC   variant), a host cell containing the vector, an isolated polypeptide
CC   encoded by the novel nucleic acid (or alternate splice variant), an
CC   antibody or antibody fragment that binds to the polypeptide,
CC   pharmaceutical compositions (comprising the nucleic acid or alternate
CC   splice variant, vector, polypeptide or antibody , and a carrier,
CC   excipient or diluent), a kit for detecting a disintegrin and
CC   metalloprotease (ADAM) gene nucleotide sequence (comprising the isolated
CC   nucleic acid or alternate splice variant, antibody or antibody fragment,
CC   and at least one component to detect the hybridisation of the variant or
CC   the binding of the antibody to an ADAM gene amino acid sequence), a kit
CC   for detecting an interactor gene amino acid sequence (comprising the
CC   antibody or antibody fragment, and at least one component to detect the
CC   binding of the antibody to the interactor gene amino acid sequence),
CC   diagnosing an ADAM or interactor gene-associated disorder or a
```

CC respiratory disorder in a human subject, determining an ADAM or
CC interactor gene pharmacogenetic profile in a human subject, identifying
CC an orthologue of a human ADAM or interactor gene, treating an ADAM or
CC interactor gene-associated disorder (or a respiratory disorder) by
CC administering the pharmaceutical composition, a transgenic mouse (whose
CC genome comprises an introduced null mutation in an endogenous gene that
CC is orthologous to a human ADAM gene), making a homozygous transgenic
CC knockout mouse, forming a crystal of the isolated polypeptide, a cell
CC line comprising the isolated nucleic acid or alternate splice variant, a
CC biochip comprising the isolated nucleic acid or alternate splice variant,
CC an isolated nucleic acid probe or primer comprising at least 8 contiguous
CC nucleotides of the nucleic acid, an isolated antisense nucleic acid,
CC identifying an ADAM or interactor gene ligand and an isolated nucleic
CC acid variant of Gene 803, 845, 847, 874 or 962. The nucleic acid or
CC alternate splice variants, methods, kits and antibody/antibody fragment
CC are useful for diagnosing and treating an ADAM or interactor gene-
CC associated disorder, e.g. asthma, atopy, obesity or inflammatory bowel
CC disease. The present sequence is a primer used to sequence the regions
CC surrounding polymorphisms in the above genes.

PT   New compounds, particularly antisense oligonucleotides targeted to a
PT   nucleic acid encoding PTP1B, useful for treating a disease/condition
PT   associated with PTP1B, such as cancer, diabetes or obesity.
XX
PS   Claim 3; SEQ ID NO 183; 143pp; English.
XX
CC   This invention relates to novel compositions and methods for modulating
CC   the expression of PTP1B (also known as protein phosphatase 1B and PTPN1).
CC   Specifically, it refers to antisense compounds that can target and
CC   hybridise with a nucleic acid molecule encoding PTP1B, as well as splice
CC   variants thereof and inhibit expression accordingly. PTP1B is a tyrosine
CC   phosphatase that plays an essential regulatory role in signalling
CC   mediated by the insulin receptor and as such is useful for treating
CC   diseases such as type 2 diabetes and obesity. Furthermore, PTP1B can
CC   suppress transformation of oncogenic genes, such that compositions of
CC   this invention can also be used to treat hyperproliferative conditions
CC   including cancer. Accordingly, these compounds can be described as having
CC   cytostatic, antidiabetic and anorectic activities. This oligonucleotide
CC   sequence is an antisense DNA oligo that targets rat PTP1B DNA, and which
CC   has a phosphorothioate backbone and 2'-O-methoxyethyl wings, used in an
CC   exemplification of the invention.

PT   New antisense oligonucleotide, having a sequence targeted to a nucleic
PT   acid encoding cyclin-dependent kinase 4, useful for preparing a
PT   composition for treating diabetes, infertility or hyperproliferative
PT   disorder, e.g., cancer.
XX
PS   Example 15; SEQ ID NO 64; 90pp; English.
XX
CC   The invention describes a new antisense oligonucleotide, having a
CC   sequence comprising 8-80 bp targeted to a nucleic acid encoding cyclin-
CC   dependent kinase 4, specifically hybridises with the nucleic acid
CC   encoding cyclin-dependent kinase 4 and inhibits expression of cyclin-
CC   dependent kinase 4. The antisense oligonucleotide is useful for preparing
CC   a composition for treating diabetes, infertility or hyperproliferative
CC   disorder, e.g., cancer. This sequence represents a human cyclin dependent
CC   kinase 4 antisense oligonucleotide.

PS   Disclosure; SEQ ID NO 578; 91pp; English.
XX
CC   This invention relates to a novel DNA molecule which comprises a DNA
CC   molecule made up of the following elements in a 5' to 3' direction: a
CC   first restriction endonuclease site; a T3 promoter site; at least one Tag
CC   gene comprising at least 5 20mer Tag sequences; a Poly A site having at
CC   least 21 consecutive A residues; a second restriction endonuclease site
CC   which may be the same or different than the first restriction
CC   endonuclease site; or a T7 Promoter on the opposite strand as the T3
CC   promoter. The invention may be useful in nucleic acid analysis, in
CC   particular to synthetic Tag genes useful as assay controls, in assay
CC   development, product development and validation and for quality control.
CC   The present sequence is that of a Tag oligonucleotide probe which may be
CC   used during the creation of the novel DNA molecule of the invention.

```

```
XX
CC   The present invention relates to antisense oligonucleotides (ADJ21603-
CC   ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence
CC   (ADJ25517), where the antisense oligonucleotide specifically hybridises
CC   with and inhibits the expression of EL. The antisense oligonucleotides
CC   are useful for modulating the expression of endothelial lipase in cells
CC   or tissues to treat diseases associated with EL expression, such as
CC   dyslipidaemia, low high density lipoprotein (HDL), cardiovascular
CC   disorder or metabolic syndrome X. In addition, the oligonucleotides are
CC   used for diagnostics, prophylaxis, or as research reagents or kits.

PT   New antisense compound, having a sequence targeted to a nucleic acid
PT   encoding endothelial specific molecule-1 (ESM-1), useful for preparing a
PT   composition for treating e.g., diabetes, cancer or cardiovascular
PT   disorder.
XX
PS   Claim 3; SEQ ID NO 972; 555pp; English.
XX
CC   The invention describes a new antisense compound, having a sequence
CC   comprising 8-30 bp targeted to a nucleic acid encoding endothelial
CC   specific molecule-1 (ESM-1), that specifically hybridises with the
CC   nucleic acid ESM-1 and inhibits its expression. Also described are: a
CC   composition; inhibiting the expression of ESM-1 in cells or tissues; and
CC   treating an animal having a disease or condition associated with ESM-1.
CC   The compound is useful for preparing a composition for treating diabetes,
CC   cancer, ischaemia or reperfusion injury, or angiogenic, immunological,
CC   cardiovascular or neurological disorder. This sequence represents an
CC   antisense oligonucleotide that can be used to modulate expression of
CC   endothelial specific molecule-1 (ESM-1).

PT New isolated polynucleotides for sensing carbohydrates, other sweeteners,
PT or ethanol, useful for screening drugs for inhibition or restoration of
PT gene function as antidiabetic, antiobesity or antialcohol consumption
PT therapies.
XX
PS Example 12; SEQ ID NO 421; 148pp; English.
XX
CC The invention relates to SAC1 polypeptides and the polynucleotides
CC encoding them. The polynucleotides contain a variation associated with
CC sensing carbohydrates, other sweeteners or ethanol. The invention also
CC relates to a method for analysing a biomolecule in a biological sample,
CC comprising altering SAC1 activity in the sample and measuring the
CC activity, a method for analysing a polynucleotide in a biological sample,
CC comprising contacting a polynucleotide in a biological sample with a
CC probe where the probe hybridises to a SAC1 polynucleotide to form a
CC hybridisation complex and detecting the hybridisation complex, a method
CC of identifying susceptibility to obesity or diabetes comprising comparing
CC the nucleotide sequence of the suspected SAC1 allele with a wild type
CC nucleotide sequence, where the difference between the suspected allele
CC and the wild-type sequence identifies a sequence variation of the SAC1
CC nucleotide sequence, and a method of treating or preventing obesity,
CC diabetes or alcoholism associated with expression of SAC1, comprising
CC administering to a subject a pharmaceutical composition and a transgenic
CC animal that carries an altered SAC1 allele. The methods and compositions
CC of the invention are useful for screening drugs for inhibition or
CC restoration of gene function as antidiabetic, antiobesity or antialcohol
CC consumption therapies and for identifying sweeteners and alcohols. This
CC sequence represents a PCR primer used to amplify murine SAC1 DNA of the
CC invention.

```
XX
CC   The invention relates to an antisense compound 8-30 nucleobases in length
CC   targeted to a nucleic acid molecule encoding Farnesoid X receptor (FXR),
CC   where the antisense compound specifically hybridizes with and inhibits
CC   the expression of FXR. The composition and methods are useful for
CC   inhibiting the expression of FXR (Farnesoid X receptor) in cells or
CC   tissues, or for treating diseases or conditions associated with FXR, such
CC   as diabetes, immunological disorders, cardiovascular disorders, e.g.
CC   dyslipidemia and its symptoms, atherosclerosis, low HDL (high density
CC   lipoprotein), elevated LDL (low density lipoprotein) or
CC   hypercholesterolemia, gallstones, hypertriglyceridemia, obesity,
CC   neurological disorders, or ischemia/reperfusion injury. In addition, the
CC   composition is used for diagnostics, prophylaxis, or as research reagents
CC   or kits. This sequence corresponds to an antisense oligonucleotide of the
CC   invention.

PT   of Gankyrin or for diagnosing or treating, e.g. hyperproliferative
PT   disorder.
XX
PS   Example 15; SEQ ID NO 17; 52pp; English.
XX
CC   The present invention relates to antisense compounds targeted to a
CC   nucleic acid encoding human Gankyrin. The antisense compound comprises an
CC   antisense oligonucleotide that specifically hybridises with the nucleic
CC   acid and inhibits the expression of Gankyrin. The antisense
CC   oligonucleotide is a chimeric oligonucleotide. The antisense
CC   oligonucleotide comprises at least one modified internucleoside linkage,
CC   preferably a phosphorothioate linkage. It also comprises at least one
CC   modified sugar moiety, preferably a 2'-O-methoxyethyl (2'-MOE) sugar
CC   moiety. The antisense oligonucleotide further comprises at least one
CC   modified nucleobase, preferably a 5-methylcytosine. The antisense
CC   oligonucleotides are useful for the treatment of diseases such as
CC   hyperproliferative disorders, e.g. cancer. The present sequence
CC   represents an antisense oligonucleotide used in the examples of the
CC   present invention.

PT   New compounds, particularly oligonucleotides targeted to a nucleic acid
PT   encoding jerky-like 1, useful for treating diseases associated with jerky
PT   -like 1, e.g. epilepsy.
XX
PS   Example 15; SEQ ID NO 21; 38pp; English.
XX
CC   The invention describes a compound 8-80 nucleobases in length targeted
CC   to, and which specifically hybridises with, a nucleic acid molecule
CC   encoding jerky-like 1, and inhibits the expression of jerky-like 1. Also
CC   described are: inhibiting the expression of jerky-like 1 in cells or
CC   tissues by contacting the cells or tissues with the compound so that
CC   expression of jerky-like 1 is inhibited; screening a modulator of jerky-
CC   like 1; a diagnostic method for identifying a disease state by
CC   identifying the presence of jerky-like 1 in a sample using any of the
CC   primers or probes given in the specification; a kit or assay device
CC   comprising the compound; and treating an animal having a disease or
CC   condition associated with by jerky-like 1 administering to the animal a
CC   therapeutic or prophylactic amount of the compound so that expression of
CC   jerky-like 1 is inhibited. The compound, composition and methods are
CC   useful for treating a disease or condition associated with jerky-like 1,
CC   such as epilepsy. They are also useful in research and diagnostics for
CC   modulating the expression of jerky-like 1. This sequence represents an
CC   antisense oligonucleotide used to control the expression of human jerky-
CC   like 1.

PT New antisense oligonucleotides encoding mitoNEET, useful for modulating
PT mitoNEET expression or for treating diseases associated with mitoNEET,
PT e.g. diabetes, immunological disorders or cardiovascular disorders.
XX
PS Claim 4; SEQ ID NO 588; 226pp; English.
XX
CC The invention comprises antisense oligonucleotides that are targeted to
CC the nucleic acids encoding a family of human proteins from mitochondrial
CC membranes, which bind insulin sensitising, antidiabetic
CC thiazolodinediones (referred to as: mitoNEET). The antisense
CC oligonucleotides of the invention are useful for modulating mitoNEET
CC expression and for treating diseases or conditions associated with
CC mitoNEET, such as: diabetes, immunological disorders, cardiovascular
CC disorders including hypertension, neurological disorders, and
CC ischaemia/reperfusion injuries. The present DNA sequence represents a
CC mitoNEET-specific antisense oligonucleotide of the invention. NOTE: The
CC present sequence is a 2'-methoxyethyl (2'-MOE) gapmer with a
CC phosphorothioate backbone.

XX
CC The present invention relates to a method for ameliorating the effects of
CC skin disorders. The method comprises contacting the skin with an
CC antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1
CC receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of
CC inhibiting or reducing growth factor mediated cell proliferation,
CC inflammation and/or other disorders. The present sequence is an
CC oligonucleotide which can be used to design the antisense
CC oligonucleotides of the present invention (see AAF45151 and AAF45153-
CC F45161). The method is useful for ameliorating the effects of psoriasis,
CC ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis,

CC neoplasias, scleroderma, warts, benign growths, cancers of the skin, a
CC hyperneovascular condition such as a neovascular condition of the retina,
CC brain or skin, growth factor-mediated malignancies, other sclerotic
CC disease, kidney disease, hyperproliferation of the inside of blood
CC vessels or any other hyperplasia

PT   New oligomers contg. modified bases - which form a triplex with G-C
PT   doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis,
PT   herpes malignancy and inflammation.
XX
PS   Claim 12; Page 65; 77pp; English.
XX
CC   The synthetic oligomer is capable of forming a triplex at physiological
CC   pH with a purine rich target sequence by coupling into the major groove
CC   of the duplex. The specific target sequence of this oligomer is an HIV
```

```
CC   target duplex contg. a purine-rich region concentrated on one chain of
CC   the duplex. The oligomer, and others like it are useful in diagnosis and
CC   therapy of diseases characterised by specific DNA duplex targets, e.g.
CC   HIV, hepatitis, herpes, malignant tumours and inflammation. The triple
CC   helices form under mild conditions thus assays may be carried out without
CC   subjecting the test specimen to harsh conditions. Additional
CC   modifications, such as altered inter- nucleotide linkages may also be
CC   incorporated, rendering the oligomer e.g. stable to nuclease activity.
CC   The oligomer is able to inhibit gene expression, as verified by in vitro
CC   systems. See also AAQ25452-25501 and AAQ30226-448. (Updated on 25-MAR-
CC   2003 to correct PN field.)

XX
PT   Detection of drug-selected mutations in the HIV protease gene used to
PT   treat HIV infections.
XX
PS   Claim 3; Page 37; 76pp; English.
XX
CC   The present invention describes the detection of drug-selected mutations
CC   in the HIV protease gene. The method of detection allows the simultaneous
CC   characterisation of a range of codons involved in drug resistance using
CC   sets of probes optimised to function together in a reverse-hybridisation
CC   assay. AAZ97517 to AAZ97997 represent specifically claimed probes for use
CC   in the assay, and AAZ97479 to AAZ97501 represent specifically claimed HIV
CC   protease gene polymorphic nucleotide sequences. AAZ97502 to AAZ97515, and
CC   AAZ98004 to AAZ98007, represent PCR primers for the HIV protease gene,
CC   and AAZ97516 represents an HIV protease probe used in an example from the
CC   present invention. The method, probes and primers can be used for the
CC   detection of drug-selected mutations in the HIV protease gene. The method
CC   allows the simultaneous characterisation of a range of codons involved in
CC   drug resistance. The method may also be used for HIV protease genotyping
CC   assays. The probes are able to discriminate between wild type and mutated
CC   protease sequences. The method allows rapid and reliable detection of
CC   drug-selected mutation in HIV. (Updated on 15-SEP-2003 to standardise OS
CC   field).

PT D2-2 protein associated with cell proliferation - used for developing
PT products for treating e.g. tumours, hyperproliferation and degenerative
PT disorders, growth deficiencies, lesions and wounds.
XX
PS Example 6.1.2; Page 89; 118pp; English.
XX
CC Differential display PCR was performed on cDNA from glioblastoma
CC multiforme tumour tissue and normal brain tissue using an oligo-T 3'
CC primer and three 5' primers, BT-8 (see AAV36504), BT-10 (see AAV36505)
CC and BT-12. A partial clone, D2-2, was obtained that is overexpressed in
CC glioblastoma tumour tissue. This was used to screen a human foetal brain
CC library to isolate a 2002 bp D2-2 clone (see AAW36503) that codes for D2-
CC 2 protein (see AAW49763). D2-2 expression is associated with cell
CC proliferation, especially with brain tumours. The invention provides
CC compositions and methods for the treatment and diagnosis of e.g. tumours,
CC hyper- and hypoproliferation disorders, growth deficiencies, lesions and
CC wounds

PT   growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
PT   central nervous system injury.
XX
PS   Claim 88; Page 72; 200pp; English.
XX
CC   The invention relates to a nucleic acid molecule which down regulates
CC   expression of a CD20 gene and a nucleic acid molecule which down
CC   regulates expression of a neurite growth inhibitor gene (NOGO). The
CC   nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
CC   DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule
CC   possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr
CC   an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
CC   with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA
CC   of CD20 in the presence of a divalent cation that is preferably Mg^2^+.
CC   Furthermore, it may be contacted with a cell to reduce CD20 activity of
CC   the cell and treat a patient having a condition associated with the level
CC   of CD20. The treatment may further comprise the use of one or more
CC   therapies. In particular, the CD20 targetting nucleic acid may be used to
CC   treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
CC   Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
CC   leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
CC   lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
CC   immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-
CC   targetting nucleic acid is used to cleave RNA of the NOGO gene in the
CC   presence of a divalent cation that is preferably Mg^2^+. Furthermore, the
CC   nucleic acid may be contacted with a cell to reduce NOGO activity of the
CC   cell and treat a patient having a condition associated with the level of
CC   NOGO. The treatment may further comprise the use of one or more
CC   therapies. In particular, the NOGO-targetting nucleic acid may be used to
CC   treat central nervous system (CNS) injury and cerebrovascular accident
CC   (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
CC   chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
CC   Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
CC   disease, muscular dystrophy, and/or other neurodegenerative disease
CC   states which respond to the modulation of NOGO expression. The present
CC   sequence is a hammerhead ribozyme of the invention

PT   Assay for screening modulators of Cdc25 activity by using a cell having a
PT   recombinant Cdc25 phosphatase gene whose expression alters the
PT   transcription of a selected gene in the presence of a modulator.
XX
PS   Example 1; Page 15; 55pp; English.
XX
CC   The invention relates to a method of identifying a modulator of Cdc25
CC   activity that comprises contacting a test cell having a recombinant Cdc25
CC   phosphatase gene whose expression alters transcription of a selected
CC   gene, with a compound under conditions where recombinant Cdc25
CC   phosphatase gene is expressed and alters the transcription of a selected
CC   gene as an indication of the compound being a modulator of Cdc25-mediated
CC   transcription. The method is useful for identifying modulators of Cdc25
CC   activity. Sequences AAF57377-390 represent exon/intron splice junction
CC   sequences of the murine Cdc25A gene

XX
CC   The invention relates to nucleic acid molecules that modulate replication
CC   of the West Nile Virus (WNV). The nucleic acid molecules are useful for
CC   treating a condition related to WNV infection e.g. pancreatitis,
CC   encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
CC   liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
CC   molecule is selected from the group of ribozymes consisting of
CC   Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The
CC   nucleic acid molecules further comprise at least five ribose residues, at
CC   least ten 2'-O-methyl modifications, phosphorothioate linkages on at
CC   least three of the 5' terminal nucleotides and a 3' end modification of a
CC   3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
CC   are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
CC   in the specification. The present sequence is that of a nucleic acid
CC   molecule of the invention

CC   encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
CC   liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
CC   molecule is selected from the group of ribozymes consisting of
CC   Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The
```

```
CC   nucleic acid molecules further comprise at least five ribose residues, at
CC   least ten 2'-O-methyl modifications, phosphorothioate linkages on at
CC   least three of the 5' terminal nucleotides and a 3' end modification of a
CC   3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
CC   are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
CC   in the specification. The present sequence is that of a nucleic acid
CC   molecule of the invention

PT   New isolated nucleic acid, useful for treating viral diseases associated
PT   with tumors and cell degeneration, also related polypeptides, antibodies
PT   and transfected cells.
XX
PS   Disclosure; Page 470; 720pp; French.
XX
CC   The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC   given in the specification, a sequence containing at least 15 consecutive
CC   nucleotides from the 17 mer sequence, a sequence with, after optimal
CC   alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC   hybridizes to them under highly stringent conditions, or the complement
CC   of any of them, or the corresponding RNA. The novel isolated nucleic
CC   acids of the invention are useful as probes and primers for detecting,
CC   identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC   component of a gene chip, in vitro as (anti)sense reagents, and for
CC   production of recombinant polypeptides. Any of the nucleic acids,
CC   polypeptides, vectors containing the nucleic acids, cells containing the
CC   vector or antibodies directed against the polypeptides are useful for
CC   preparation of pharmaceuticals for prevention and/or treatment of viral
CC   diseases that are characterised by development of tumours or cell
CC   degeneration, specifically cancer but also Alzheimer's disease and
CC   schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC   patient samples is useful for diagnosis and/or prognosis of these
CC   diseases. The polypeptides can also be used to generate antibodies, and
CC   both the polypeptide and antibodies are useful as components of protein
CC   chips. The nucleic acid sequences of the invention can be used in gene
CC   therapy. This polynucleotide sequence represents a tumour suppression
CC   related human fukutin oligonucleotide of the invention

PT   Novel short interfering RNA and enzymatic nucleic acid useful for
PT   treating cancer, modulates the expression of a nucleic acid encoding
PT   HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
XX
PS   Claim 4; Page 149; 185pp; English.
XX
CC   The invention relates to a novel short interfering RNA (siRNA) nucleic
CC   acid molecule or an enzymatic nucleic acid molecule, that modulates
CC   expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras,
CC   human immunodeficiency virus (HIV) or a component of HIV. The nucleic
CC   acid molecule of the invention has cytostatic, anti-HIV, and anti-
CC   rheumatic activity. The nucleic acid molecules are useful for reducing
CC   HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are
CC   also useful for treating breast, ovarian, colorectal, lung, prostate,
CC   bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences
CC   shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524,
CC   ABZ66530 - ABZ66585 represent substrate/target sequences for the human
CC   ribozymes of the invention

PS   Disclosure; Page 304; 771pp; French.
XX
CC   The invention relates to the isolation of 6327 nucleotide sequences,
CC   fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC   sequence having at least 80% identity, after optimal alignment, with the
CC   nucleotides, a sequence that hybridizes under stringent conditions with
CC   the nucleotides, or the complement, or corresponding RNA, of the
CC   nucleotides. The nucleotides are used as probes or primers for detecting,
CC   identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC   sense and antisense sequences, of nucleotides involved in tumour
CC   suppression or reversion, apoptosis and or viral resistance, to produce
CC   recombinant polypeptides, and to prepare transgenic animals, as
CC   experimental models. The nucleotides (also vectors containing them and
CC   cells containing the vectors), the encoded polypeptides and antibodies
CC   (Ab) against the polypeptide are useful for prevention and/or treatment
CC   of viral infections or diseases characterized by development of tumours
CC   or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC   Analysis of the expression of the nucleotides can be used for diagnosis
CC   and/or prognosis of these diseases. The nucleotides and polypeptides can
CC   also be used to screen for their specific interactive molecules,
CC   potentially useful for treating diseases associated with abnormal
CC   expression of the nucleotides.

PS   Disclosure; SEQ ID NO 3552; 30pp; French.
XX
CC   This invention relates to novel isolated nucleic acid sequences involved
CC   in the phenomena of tumour suppression, tumour reversion, apoptosis
CC   and/or resistance to viruses. The invention may be useful for the
CC   development of compounds with a cytostatic, virucide, neuroprotective,
CC   nootropic or neuroleptic activity. The DNA sequences may be useful as
CC   probes and primers for detecting, indentifying, quantifying and/or
CC   amplifying nucleic acid, for example as one component of a gene chip, in
CC   vitro as antisense reagents and for production of recombinant
CC   polypeptides. The invention may therefore be useful for preparation of
CC   pharmaceuticals for prevention and/or treatment of viral diseases that
CC   are characterised by development of tumours or cell degeneration,
CC   specifically cancer but also Alzheimer's disease and schizophrenia. The
CC   present sequence is that of a nucleic acid sequence of the invention.
CC   Note: The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/publishedpct_sequences

PT   Novel enzymatic nucleic acid that down-regulates expression of neurite
PT   growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
PT   protein kinase PKR genes, for treating cancer and inflammatory disease.
XX
PS   Claim 161; SEQ ID NO 5457; 317pp; English.
XX
CC   The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC   that down regulate the expression or inhibit the function of a receptor
CC   for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC   IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC   invention are useful for treating: cerebrovascular accident, central
CC   nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC   lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC   restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC   disease, lupus, multiple sclerosis, transplant/graft rejection,
CC   ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC   conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC   nucleic acids of the invention are also useful for down-regulating the
CC   expression of a target gene and as a diagnostic tool to examine genetic
CC   drifts and mutations within diseased cells or to detect the presence of a
CC   target RNA in a cell. The present RNA sequence represents a human PKR
CC   substrate sequence.

PT   Diagnosing glioma by detecting expression product of any one of 255
PT   genes, glioma endothelial markers, in brain tissue sample suspected of
PT   being neoplastic, and comparing the expression with expression in normal
PT   brain tissue sample.
XX
PS   Example 2; SEQ ID NO 498; 114pp; English.
XX
CC   The present invention describes a method (M1) for aiding in the diagnosis
CC   of glioma. (M1) involves detecting an expression product of at least one
CC   gene (I) in a first brain tissue sample (T) suspected of being
CC   neoplastic, where (I) is chosen from any one of 255 genes (glioma
CC   endothelial markers (GEMs)) as given in specification, and comparing the
CC   expression of (I) in (T) with expression of (I) in a second normal brain
CC   tissue sample (R), where increased expression of (I) in (T) relative to
CC   (R), identifies (T) as likely to be neoplastic. Also described: (1)
CC   treating (M2) glioma involves contacting cells of the glioma with an
CC   antibody that specifically binds to a extracellular epitope; (2)
CC   identifying (M3) a test compound as potential anticancer or antiglioma
CC   drug involves contacting a test compound with the cell which expresses
CC   (I), monitoring an expression product of the at least one gene and
CC   identifying test compound as a potential anticancer drug if it decreases
CC   the expression of at least one gene; (3) identifying (M4) a test compound
CC   as potential anticancer or antiglioma drug involves contacting a test
CC   compound with the cell which expresses mRNA of at least one gene
CC   identified by a tag as described above, monitoring mRNA of the gene, and
CC   identifying the test compound as a potential anticancer drug if it
CC   decreases the expression of at least one gene; and (4) inducing (M5) an
CC   immune response to glioma involves administering to a mammal, a protein
CC   or (I). (I) have cytostatic activities, and can be used to trigger immune
CC   destruction of glioma cells, and as immune response inducers. (M1) is
CC   useful for aiding in diagnosing glioma. (M2) is useful for treating multi
CC   -drug sensitive glioma in a human. (M5) is useful for inducing an immune
CC   response to a glioma in a mammal having glioma or in a mammal who has had
CC   a glioma surgically removed. The present sequence represents a human GEM
CC   long tag oligonucleotide, which is used in the exemplification of the
CC   present invention.

PT   Antisense compound which modulates human sentrin expression, useful for
PT   treating diseases associated with sentrin expression.
XX
PS   Example 15; Col 38; 29pp; English.
XX
CC   The present invention describes an antisense compound (I) 8-30
CC   nucleotides long targeted to a nucleic acid molecule encoding human
CC   sentrin. The antisense compound comprises a phosphorothioate antisense
CC   oligonucleotide which inhibits expression of human sentrin. (I) is useful
CC   for inhibiting expression of sentrin in human cells or tissues in vitro,
CC   for treating humans or other animals suspected of having or being prone
CC   to a disease associated with sentrin expression. (I) can also be used for
CC   research or diagnostic purposes. The present sequence represents a human
CC   sentrin phosphorothioate antisense oligonucleotide from the present
CC   invention

PT   Novel biallelic markers used to construct a high density disequilibrium
PT   map of the human genome.
XX
PS   Claim 9; Page 1781; 2745pp; English.
XX
CC   AAZ65654 to AAZ69578 represent human biallelic markers from the present
CC   invention, which contain a polymorphic base at position 24 of their
CC   nucleotide sequences. AAZ69579 to AAZ77440 represent amplification
CC   primers for the biallelic markers. The biallelic markers of the invention
CC   have a variety of uses: they can be used for high density mapping of the
CC   human genome, and in complex association studies and haplotyping studies
CC   which are useful in determining the genetic basis for disease states.
CC   Compositions and methods of the invention can also be useful for the
CC   identification of the targets for the development of pharmaceutical
CC   agents and diagnostic methods, as well as the characterisation of the
CC   differential efficacious responses to and side effects from
CC   pharmaceutical agents acting on a disease as well as other treatment.

PT   Novel polypeptides and nucleic acids homologous to members of collagen,
PT   potassium channel, tuftelin family of proteins for diagnosing, treating
PT   cancer, atherosclerosis, neurological, skin and enamel defect disorders.
XX
PS   Example 1; Page 116; 128pp; English.
XX
CC   The invention relates to isolated NOVX (NOVX1-11) polypeptides and the
CC   polynucleotides that encode them. NOVX polypeptides, polynucleotides and
CC   anti-NOVX antibodies are useful for treating or preventing a pathology
CC   associated with NOVX polypeptide in humans and for treating a syndrome
CC   associated with human disease e.g. disorders characterised by altered
CC   cell motility, proliferation and migration e.g. cancer, angiogenesis and
CC   wound healing (NOV1-3), neurological disorders, e.g. episodic ataxia,
CC   autosomal dominant myokymia, stroke, Parkinson's disease, Alzheimer's
CC   disease, non-insulin dependent diabetes mellitus, asthma, hypertension
CC   and seizure (NOV4), enamel defects, such as amelogenesis imperfecta and
CC   disorders involving enamel defects, including hypoplasia and
CC   hypomineralisation (NOV5-7), paraneoplastic neurological disorders, e.g.
CC   paraneoplastic limbic of brain-stem encephalitis occurring during
CC   testicular cancer, diabetes, reproductive health, metabolic and endocrine
CC   disorders, gastrointestinal disorders, immune disorders and autoimmune
CC   diseases, respiratory disorders, bone disorders, musculoskeletal
CC   disorders, leukaemia/lymphoma and tissue/cell growth regulation disorders
CC   (NOV8), lesional psoriatic skin (NOV9-10) and atherosclerosis, abdominal
CC   aortic aneurysm and neurological disorders (NOV11). NOVX polypeptide is
CC   also useful for identifying an agent that binds to it and a cell
CC   expressing NOVX polypeptide is useful for identifying a therapeutic agent
CC   for use in treatment of a NOVX related pathology. The antibodies and a
CC   polypeptide having 95% sequence identity to NOVX polypeptide are useful
CC   for treating a pathological state in a mammal. The present sequence is a
CC   PCR primer used to isolate the cDNA encoding NOV3, a new collagen family
CC   member

PT   New nucleic acids, useful in recombinant adeno-associated virus virion
PT   production, comprises adenoviral coding region of VA RNA, E4 ORF6, E2A
PT   72kD and E1A, and E1B region lacking intact E1B55K coding region.
XX
PS   Example 1; Page 32; 61pp; English.
XX
CC   The invention relates to a nucleic acid molecule which provides one or
CC   more accessory functions for supporting recombinant adenoassociated virus
CC   (rAAV) virion production in a suitable host cell. The molecule comprises
CC   a VA RNA coding region, E4 open reading frame (ORF) 6 coding region, E2A
CC   72kD coding region, E1A coding region and E1B region lacking an intact
CC   E1B55K coding region of an adenovirus (AV). An accessory function vector
CC   comprising the molecule is useful for producing rAAV. The method
CC   comprises introducing AAV vector into a suitable host cell, introducing
CC   an AAV helper construct into the cell, where the helper construct
CC   comprises AAV coding regions that are expressed in the host cell to
CC   complement AAV helper functions missing from AAV vector, introducing the
CC   accessory function vector into the cell; and culturing the cell to
CC   produce rAAV virions. The method can alternately be performed by two
CC   other methods. The molecule yields significant levels of rAAV particles
```

```
CC   without also generating significant levels of infectious helper virus or
CC   contaminating by-products. Sequences AAI67726-27 represent oligos used
CC   for causing E1B55K alterations

PT   Linked linear amplification of nucleic acid sequence of interest
PT   contained within complementary nucleic acids by using series of nested
PT   primers each of which contains a non-replicable element and/or cleavable
PT   element.
XX
PS   Example 7; Col 20; 42pp; English.
XX
CC   This invention relates to a novel method of nucleic acid amplification
CC   called linked linear amplification (LLA). The method involves
CC   simultaneously combining a series of nested primers by combining nucleic
CC   acid template with nested primer each containing non-replicable element
CC   and/or cleavable element. The series of nested primers comprise primers
CC   complementary to different portions of the template and are 5' to one
CC   another with respect to the template and do not overlap with one another
CC   at the position of the non-replicable and cleavable elements. The method
CC   of the invention may be used for amplifying nucleic acid sequences of
CC   interest contained in the complementary first and second nucleic acid
CC   strands which are prepared from RNA by reverse transcription. This method
CC   is capable of producing large quantities of a specific nucleic acid
CC   sequence of interest. The products are single stranded and do not have to
CC   be denatured prior to detection. As the products accumulate linearly,
CC   they can be accurately identified. The occurrence of false positives will
CC   be reduced in comparison with exponential processes that use newly
CC   synthesised DNA as template in subsequent rounds using the same primer.
CC   The present sequence represents the GH-3 human growth hormone linked
CC   linear amplification primer used to amplify human growth hormone gene

PT   New polynucleotides and polypeptides are useful in gene therapy, for
PT   developing a diagnostic marker or medicines for regulating their
PT   expression and activity, or as a target of gene therapy.
XX
PS   Example 8; SEQ ID NO 4912; 305pp; English.
XX
CC   The invention relates to a novel human polynucleotide and the encoded
CC   polypeptide. A polynucleotide of the invention may have a use in gene
CC   therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful
CC   as a primer for synthesizing the polynucleotide or as a probe for
CC   detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are
CC   useful in gene therapy, for developing a diagnostic marker or medicines
CC   for regulating their expression and activity, or as a target of gene
CC   therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides
CC   are useful as pharmaceutical agents. The present sequence represents an
CC   oligonucleotide used in the invention.

PT   Generating cDNA molecules using a linked series of multi-cycle primer
PT   extension reactions, useful for the in vitro replication of nucleic
PT   acids, in particular for replicating a nucleic acid sequence of interest
PT   in large quantities.
XX
PS   Example 7; SEQ ID NO 16; 54pp; English.
XX
CC   The invention describes a process for generating a cDNA molecule from an
CC   RNA molecule. The method comprises annealing a first primer containing a
CC   non-replicable element, to an RNA molecule, generating a first strand
CC   product, separating the first cDNA from its template to produce single
CC   stranded molecules, annealing a second primer containing a non-replicable
CC   element, to the first cDNA product, and generating a second cDNA product
CC   that is a complement of the first cDNA. The first and second primers in
CC   the process cited above is with or without a cleavable element. The
CC   methods and compositions are useful for the in vitro replication of
CC   nucleic acids, in particular for replicating a nucleic acid sequence of
CC   interest, with large quantities of the desired sequence ultimately
CC   resulting from the linkage of extension reactions where the sequence of
CC   interest accumulates in a mathematically linear fashion. This sequence
CC   represents a polynucleotide template DNA used to demonstrate the ability
CC   of the 1,3 propane diol moiety to serve as a non-replicable element.

PT   Isolated nucleic acid molecules having polymorphisms in known human genes
PT   e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers
PT   for locating, identifying and characterizing the genes responsible for
PT   disorder-related traits.
XX
PS   Example 18; Page 133; 714pp; English.
XX
CC   This invention relates to the sequence of an isolated nucleic acid
CC   molecule comprising at least one base variation from that of a known
CC   human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2),
CC   cytochrome P450 02E1 (CYP45002E1), adrenergic receptor beta1 (ADBR1),
CC   aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator
CC   (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding
CC   inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating
CC   protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl
CC   transferase (HNMT), (kallikrein 2) KLK2, nicotinamide -N-methyl
CC   transferase (NNMT), NADPH quinone oxidoreductase 2 (NQO2),
CC   sulfotransferase thermolabile (STM), UDP-glucuronosyl transferase 2B4
CC   (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl
CC   transferase (UGT2B15), urokinase receptor (uPA), multidrug resistance 1
CC   (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3
CC   (MRP3), orphan nuclear receptor (NR1I2), or acetylcholine muscarinic
CC   receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence.
CC   The polymorphisms in the human genes cited in the invention are useful as
CC   genetic linkage markers for locating and characterising the genes that
CC   are responsible for specific traits within the genome and eventually
CC   identifying the genes responsible for a variety of disorder-related
CC   traits as a result of their e.g., overexpression, constitutive
CC   expression, mutation or underexpression, which may be used in diagnosing
CC   and/or treating the disorders. The nucleic acid molecules comprising the
CC   polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1,
CC   ARNT, EPHX2, GST12, NNMT, NQO2, NR1I2, STM, UGT2B4, UGT2B7, UGT2B15, AHR,
CC   MDR1 and/or MDR3 are useful for screening individuals for altered drug
CC   metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2,
CC   AHR, MDR1 and/or MDR3 may also be used to screen individuals for
CC   susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are
CC   used to screen for altered cardiovascular function, in COX2 for altered
CC   susceptibility to colorectal tumours, in DBI or CHMR1 for altered central
CC   nervous system function, in FLAP and HNMT for altered pulmonary,
CC   immunological or haematological function, in KLK2 for altered serine
CC   protease activity in the prostate, in LTF for altered immunological or
```

```
CC   haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and
CC   peripheral nervous system function. The present sequence represents a PCR
CC   primer used to amplify the sequences of the invention

PT   New double-stranded interfering nucleic acid, useful e.g. for treatment
PT   and diagnosis of cancer, downregulates the vascular endothelial growth
PT   factor receptor gene.
XX
PS   Example 3; SEQ ID NO 100; 207pp; English.
XX
CC   The present invention describes a double-stranded short interfering
CC   nucleic acid (siNA) that downregulates expression of the vascular
CC   endothelial growth factor receptor (VEGFR) gene. Also described: (1) a
CC   siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo
CC   delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors
CC   that express siNA; and (5) single-stranded siNA with similar properties.
CC   The siNAs have antiangiogenic, cytostatic, antidiabetic,
CC   ophthalmological, antiarthritic, antipsoriatic, nephrotropic and
CC   gynaecological activities. The siNA are useful for modulating
CC   (downregulating) the expression of VEGFR genes. The siNA are potentially
CC   useful for treating a wide range of angiogenesis-associated conditions,
CC   particularly cancers, diabetic retinopathy, macular degeneration,
CC   neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma,
CC   and polycystic kidney disease. The siNA may also be useful for diagnosis,
CC   drug screening, target identification and validation, genetic
CC   engineering, studying gene function, and also for gene mapping (e.g. of
CC   single-nucleotide polymorphisms). The present sequence is used in the
CC   exemplification of the present invention.

PT   New double-stranded interfering nucleic acid, useful e.g. for treatment
```

```
PT   and diagnosis of cancer, downregulates the vascular endothelial growth
PT   factor receptor gene.
XX
PS   Example 3; SEQ ID NO 527; 207pp; English.
XX
CC   The present invention describes a double-stranded short interfering
CC   nucleic acid (siNA) that downregulates expression of the vascular
CC   endothelial growth factor receptor (VEGFR) gene. Also described: (1) a
CC   siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo
CC   delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors
CC   that express siNA; and (5) single-stranded siNA with similar properties.
CC   The siNAs have antiangiogenic, cytostatic, antidiabetic,
CC   ophthalmological, antiarthritic, antipsoriatic, nephrotropic and
CC   gynaecological activities. The siNA are useful for modulating
CC   (downregulating) the expression of VEGFR genes. The siNA are potentially
CC   useful for treating a wide range of angiogenesis-associated conditions,
CC   particularly cancers, diabetic retinopathy, macular degeneration,
CC   neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma,
CC   and polycystic kidney disease. The siNA may also be useful for diagnosis,
CC   drug screening, target identification and validation, genetic
CC   engineering, studying gene function, and also for gene mapping (e.g. of
CC   single-nucleotide polymorphisms). The present sequence is used in the
CC   exemplification of the present invention.

PT   Oligo:nucleotide which reduces CD28 gene expression in T cells - for
PT   treating immune system diseases, e.g. graft vs. host disease, septic
PT   shock, psoriasis, etc.
XX
PS   Example 1; Page 27; 77pp; English.
XX
CC   The present oligonucleotide reduces T cell CD28 gene expression, useful
CC   in the treatment of CD28 mediated diseases, particularly immune system
CC   disorders, e.g. graft versus host disease, septic shock, viral disease,
CC   psoriasis, type I diabetes mellitus, thyroiditis, sarcoides, multiple
CC   sclerosis, uveitis, rheumatoid arthritis, systemic lupus erythematosus,
CC   inflammatory bowel disease, etc. . Reducing CD28 expression may reduce the
CC   effects of antigenic stimulation of CD28 positive T cells, with a
CC   consequent reduction in cytokine release. (Updated on 25-MAR-2003 to
CC   correct PR field.)

PT   New fibrin-binding peptide molecules - used for the diagnosis and
PT   treatment of conditions associated with fibrin deposition, e.g. thrombi.
XX
PS   Example 4; Page 61; 146pp; English.
XX
CC   PCR primers (AAT17552-69) were used to amplify DNA encoding C-terminal
CC   fragments of human fibronectin (Fn). This C-terminal region includes an
CC   11 kDa fibrin-binding peptide (amino acids 2123-2230) that covers the
CC   type I modules 10F1.11F1 of Fn (see also AAR92778). It is useful for the
CC   diagnosis and treatment of conditions associated with fibrin deposition.
CC   Peptides were expressed from a system based on the yeast alpha-factor
CC   secretion pathway and were obtd. in yields of 10-100 mg/ml. Use of
CC   primers 11K A (AAT17552) and 11K B (AAT17553) amplified DNA coding for
CC   the 11 kDa fibrin-binding peptide

XX
PS   Disclosure; Page 1825; 1755pp; English.
XX
CC   PCR primers AAZ01426-Z06209 were used to amplify open reading frames
CC   (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs
CC   encode polypeptides (see AAY36754-Y37949) which can be used as vaccines
CC   against Chlamydia trachomatis. Antisense and ribozyme sequences can also
CC   be used to control growth of the microorganism. Chlamydia trachomatis is
CC   responsible for a large number of diseases, e.g. eye diseases such as
CC   conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion
CC   conjunctivitis; genital diseases such as nongonococcal uretritis,
CC   epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis;
CC   pneumopathy in breast feeding infants; and venereal lymphogranulomatosis.
CC   The polypeptides of the invention may be of use in treating these
CC   diseases

PT   New polynucleotide encoding avian lectin receptor, for e.g. identifying
PT   modulators for controlling appetite and energy balance in poultry.
XX
PS   Example; Page 28; 67pp; English.
XX
CC   The present DNA sequence is mouse specific leptin receptor forward RT
CC   (Reverse Transcriptase)-PCR primer which is used for amplifying the cDNAs
CC   corresponding to exon 20 of mouse leptin receptor gene. The invention
CC   relates to chicken leptin receptor and its corresponding DNA molecule.
CC   Leptin receptor is used for regulating appetite and other aspects of
CC   energy balance in poultry such as food consumption, fat deposition,
CC   puberty, thermoregulation, immunity, angiogenesis and energy expenditure.
CC   Leptin receptor is specifically used for attenuating leptin activity in
CC   vivo (particularly using a soluble form of the receptor, optionally
CC   expressed from a transgene). Leptin receptor provides a replacement for
CC   the forced molting procedure to improve performance and profitablity of
CC   old laying hens. The invention provides an assay for screening leptin
CC   agonists and antagonists. The invention is also used to isolate leptin
CC   gene and to establish a bioassay for leptin activity, e.g. to screen for
CC   birds with high or low leptin levels in the blood (e.g. for breeding
```

PT   Novel antisense compounds targeting nucleic acid encoding groEL or groES
PT   gene of microorganism, which hybridize with and inhibit expression of the
PT   genes, useful to inhibit growth of microorganism having the genes.
XX
PS   Claim 3; Page 52; 110pp; English.
XX
CC   The present invention specifically claims AAH56368 to AAH56832 which are
CC   antisense oligonucleotides to nucleotide sequences encoding groE. More
CC   generally, antisense compounds (I) comprising antisense oligonucleotides
CC   of 5-50 bases targeted to a nucleotide sequence encoding groEL (heat
CC   shock protein (HSP)60) (GL) and groES (HSP10) (GS) gene from a
CC   microorganism, where the antisense compound is complementary to GL or GS
CC   of a microorganism and specifically hybridises with and inhibits the
CC   expression of GL or GS, is claimed. (I) have antibacterial, antiviral and
CC   antiproliferative activities, and can be used in antisense therapy and
CC   for inhibition of expression of groES or groEL. (I) are useful for
CC   inhibiting expression of GL or GS in cells or tissues in vitro. (I) are
CC   also useful for inhibiting the growth of a microorganism, or inhibiting
CC   the expression of GL or GS gene in a microorganism (a bacterial cell or a
CC   virus) having a GL or GS gene which involves administering to the
CC   microorganism or to a cell infected with the microorganism, (I). (I) are
CC   also useful for treating a mammalian pathological condition mediated by
CC   the microorganisms which involves identifying a eukaryotic organism
CC   having a pathological condition mediated by microorganisms having a GL or
CC   GS gene and administering (I) such that the growth of microorganism is
CC   inhibited. The antisense compounds are utilised for diagnostics,
CC   therapeutics, prophylaxis and as research reagents and kits, e.g., to
CC   prevent or delay microbial infections in humans. They are also useful as
CC   molecular weight markers. AAH56362 to AAH56367 and AAH56833 to AAH56854
CC   represent PCR primers for groE sequences which are used in the
CC   exemplification of the present invention. AAH56855 to AAH56870 represent

PT   Antisense oligonucleotides for inhibiting the expression of the human
PT   protein kinase A catalytic subunit C-alpha, particularly useful for
PT   preventing, delaying or treating infection, inflammation or tumor
PT   formation.
XX
PS   Claim 1; Col 45; 35pp; English.
XX
CC   The invention is directed to antisense compounds, particularly
CC   oligonucleotides which are targetted to a DNA encoding human protein
CC   kinase A (PKA) catalytic subunit C-alpha to modulate (inhibit) its
CC   expression. The antisense compounds are useful for diagnostics,
CC   therapeutics, prophylaxis and as research reagents or kits. The antisense
CC   oligonucleotides are useful for treating human, suspected of having or
CC   being prone to a disease or condition associated with the expression of
CC   PKA catalytic subunit C-alpha. In particular, the antisense
CC   oligonucleotides are useful for preventing, delaying or treating
CC   infection, inflammation and tumour formation. They are also useful in
CC   antisense therapy. The present sequence is a chimeric antisense
CC   oligonucleotide with a phosphorothioate backbone. This oligo is targetted
CC   to the coding region of human PKA catalytic subunit C-alpha to inhibit
CC   its expression

PT   Compound for inhibiting the expression of protein phosphatase 1B (PTP1B)
PT   and for treating diabetes, cancer, or obesity, comprises an antisense
PT   oligonucleotide targeted to nucleic acid encoding PTP1B.
XX
PS   Claim 3; Page 24; 133pp; English.
XX
CC   The invention relates to a compound of 8-50 nucleobases in length
CC   targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where
CC   the compound specifically hybridises with and inhibits the expression of
CC   PTP1B (e.g. an antisense oligonucleotide). Also included are (1) a
CC   compound of 8-50 nucleobases in length which specifically hybridises with
CC   an 8 nucleobase portion of an active site on a nucleic acid encoding
CC   PTP1B; (2) inhibiting the expression of PTP1B in cells or tissues
CC   comprising contacting the cells or tissues with the compound; treating an
CC   animal having or suspected of having a disease or condition associated
CC   with PTP1B comprising administering the compound; (4) decreasing blood
CC   sugar levels in an animal comprising administering the compound; (5)
CC   preventing or delaying the onset of a disease or condition associated
CC   with PTP1B in an animal comprising administering the compound; and (6)
CC   preventing or delaying the onset of an increase in blood glucose levels
CC   in an animal comprising administering the compound. The compound is used
CC   to inhibit the expression of PTP1B in cells or tissues, to treat or
CC   prevent or delay the onset of a disease or condition associated with
CC   PTP1B, such as type 2 diabetes, obesity, cancer (especially ovarian
CC   cancer, chronic myeloid leukaemia and hyperproliferative diseases in an
CC   animal having or suspected of having the disease or condition, and for
CC   decreasing blood sugar levels or preventing or delaying the onset of an
CC   increase in blood glucose levels in an animal. The compound is also used
CC   in diagnostics, therapeutics, prophylaxis, and in research reagents and
CC   kits. The present sequence is an antisense compound of the invention
CC   targetting rat PTP1B

PT   Novel antisense compound useful for treating type 2 diabetes, cancer and
PT   obesity, is targeted to nucleic acid encoding human protein phosphatase
PT   1B, and hybridizes and inhibits PTP1B expression.
XX
PS   Claim 3; Page 71; 142pp; English.
XX
CC   The invention relates to a compound targeted to a nucleic acid molecule
CC   encoding protein phosphatase 1B (PTP1B), which specifically hybridises
CC   with and inhibits the expression of PTP1B. The compounds of the invention
CC   are useful for inhibiting the expression of PTP1B in liver, kidney or
CC   adipose cells or tissues and for treating an animal, preferably human,
CC   having a disease or condition associated with PTP1B, including metabolic
CC   diseases or conditions, e.g. type 2 diabetes and obesity, or
CC   hyperproliferative conditions such as cancer. The sequences are also
CC   useful for decreasing blood (serum or plasma) glucose levels in an animal
CC   e.g. a diabetic human or rodent, for preventing or delaying the onset of
CC   a disease or condition associated with PTP1B , and for preventing or
CC   delaying the onset of an increase in blood glucose levels. This sequence
CC   represents a PTP1B mRNA level inhibition antisense oligonucleotide of the
CC   invention

PT   Determining the likelihood of tumor re-occurrence in a patient previously
PT   diagnosed with a breast tumor to determine treatment modalities,
PT   comprises analyzing the cell sample for loss of heterozygosity to
PT   chromosomal locus 3p24.3.
XX
PS   Example 1; Page 37; 42pp; English.
XX
CC   The invention relates to a method of determining the likelihood of tumour
CC   re-occurrence in a patient previously diagnosed with a breast tumour. The
CC   method involves analysing the target cell sample for loss of
CC   heterozygosity (LOH) to chromosomal locus 3p24.3. The method is useful
CC   for determining the likelihood of tumour re-occurrence in a patient
CC   previously diagnosed with a breast tumour and subsequently useful in
CC   determining the degree of aggressive treatment indicated. The prognostic
CC   method is especially useful in making decisions concerning treatment
CC   modalities, including therapeutic intervention, diagnostic criteria such
CC   as disease staging and disease monitoring and surveillance for metastasis
CC   or recurrence of neoplastic disease. The present sequence is a PCR primer
CC   used for LOH analysis. This primer is used to illustrate the method of
CC   the invention

PT   New antisense oligonucleotides for modulating human farnesoid X receptor
PT   (FXR) expression, useful for treating conditions associated with FXR in
PT   humans, e.g. cardiovascular disease, atherosclerosis or
PT   hypercholesterolemia.
XX
PS   Claim 3; Page 75; 127pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of human farnesoid X receptor (FXR). FXR is
CC   also known as NR1H4, retinoid X receptor-interacting protein 14 (RIP14)
CC   and bile acid receptor (BAR). The antisense oligonucleotide is useful for
CC   inhibiting the expression of human FXR in cells or tissues. It is
CC   particularly useful for treating or preventing a disease or condition
CC   associated with FXR in a human, e.g. cardiovascular disease,
CC   atherosclerosis or hypercholesterolaemia. The antisense compound is
CC   useful for diagnostics, therapeutics, prophylaxis, or as research
CC   reagents or kits. It is also used in gene therapy. The present sequence
CC   is an antisense oligonucleotide targetted to human FXR DNA. This sequence
CC   is used to illustrate the method of the invention

PT   bronchodilating agent.
XX
PS   Claim 15; SEQ ID NO 912; 763pp; English.
XX
CC   This invention describes a novel composition (a) a first active agent,
CC   comprising oligonucleotides, effective for alleviating
CC   bronchoconstriction, respiratory tract inflammation, allergies and
CC   reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC   surfactant depletion or hyposecretion, when administered to a mammal. The
CC   oligonucleotides are derived from a gene encoding or regulating
CC   expression of a target polypeptide associated with lung airway or lung
CC   dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC   The invention also describes a kit, that comprises: (a) a delivery
CC   device, in separate containers, (b) the oligonucleotides, (c)
CC   instructions for adding a carrier and for use of the kit. The composition
CC   of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC   analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC   beta-adrenergic agonist. The composition is useful for preventing or
CC   treating a respiratory, lung or malignant disease. The administered
CC   composition comprises oligo and is administered to reduce the production
CC   or availability, or to increase the degradation of the target mRNA or to
CC   reduce the amount of target polypeptide present in the lungs. The
CC   pulmonary obstruction, and/or bronchoconstriction and/or lung
CC   inflammation, allergies and/or surfactant hypoproduction are associated
CC   with a disease or condition such as pulmonary vasoconstriction,
CC   inflammation, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC   transplantation rejection, pulmonary infections, bronchitis or cancer.
CC   The reduced adenosine content of the anti-sense oligos corresponding to
CC   thymidines present in the target RNA serves to prevent the breakdown of
CC   the oligonucleotides into products that free adenosine into the system
CC   e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC   prevent any unwanted effects due to it

XX
CC   This invention describes a novel composition (a) a first active agent,
CC   comprising oligonucleotides, effective for alleviating
CC   bronchoconstriction, respiratory tract inflammation, allergies and
CC   reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC   surfactant depletion or hyposecretion, when administered to a mammal. The
CC   oligonucleotides are derived from a gene encoding or regulating
CC   expression of a target polypeptide associated with lung airway or lung
CC   dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC   The invention also describes a kit, that comprises: (a) a delivery
CC   device, in separate containers, (b) the oligonucleotides, (c)
CC   instructions for adding a carrier and for use of the kit. The composition
CC   of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC   analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC   beta-adrenergic agonist. The composition is useful for preventing or
CC   treating a respiratory, lung or malignant disease. The administered
CC   composition comprises oligo and is administered to reduce the production
```

```
CC   or availability, or to increase the degradation of the target mRNA or to
CC   reduce the amount of target polypeptide present in the lungs. The
CC   pulmonary obstruction, and/or bronchoconstriction and/or lung
CC   inflammation, allergies and/or surfactant hypoproduction are associated
CC   with a disease or condition such as pulmonary vasoconstriction,
CC   inflammation, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC   transplantation rejection, pulmonary infections, bronchitis or cancer.
CC   The reduced adenosine content of the anti-sense oligos corresponding to
CC   thymidines present in the target RNA serves to prevent the breakdown of
CC   the oligonucleotides into products that free adenosine into the system
CC   e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC   prevent any unwanted effects due to it

PT   New compounds, particularly antisense oligonucleotides targeted to a
PT   nucleic acid encoding PTP1B, useful for treating a disease/condition
PT   associated with PTP1B, such as cancer, diabetes or obesity.
XX
PS   Claim 3; SEQ ID NO 130; 143pp; English.
XX
CC   This invention relates to novel compositions and methods for modulating
CC   the expression of PTP1B (also known as protein phosphatase 1B and PTPN1).
CC   Specifically, it refers to antisense compounds that can target and
CC   hybridise with a nucleic acid molecule encoding PTP1B, as well as splice
CC   variants thereof and inhibit expression accordingly. PTP1B is a tyrosine
CC   phosphatase that plays an essential regulatory role in signalling
CC   mediated by the insulin receptor and as such is useful for treating
CC   diseases such as type 2 diabetes and obesity. Furthermore, PTP1B can
CC   suppress transformation of oncogenic genes, such that compositions of
CC   this invention can also be used to treat hyperproliferative conditions
CC   including cancer. Accordingly, these compounds can be described as having
CC   cytostatic, antidiabetic and anorectic activities. This oligonucleotide
CC   sequence is an antisense DNA oligo that targets rat PTP1B DNA, and which
CC   has a phosphorothioate backbone and 2'-O-methoxyethyl wings, used in an
CC   exemplification of the invention.

PT   New antisense compounds targeted to nucleic acid molecules encoding polo-
PT   like kinase, useful for treating diseases associated with aberrant
PT   expression of polo-like kinase, e.g. non-small cell lung cancer or
PT   esophageal cancer.
XX
PS   Example 15; SEQ ID NO 15; 138pp; English.
XX
CC   The present invention describes a compound (I) of 8-80 nucleobases in
CC   length targeted to a nucleic acid molecule encoding polo-like kinase,
CC   where (I) specifically hybridises with nucleic acid molecule encoding
CC   polo-like kinase and inhibits the expression of polo-like kinase, or
CC   specifically hybridises with at least an 8-nucleobase portion of a
CC   preferred target region on a nucleic acid molecule encoding polo-like
CC   kinase. Also described: (1) a composition comprising (I) and a
CC   pharmaceutical carrier or diluent; (2) inhibiting the expression of polo-
CC   like kinase in cells or tissues comprising contacting the cells or
CC   tissues with (I); (3) treating an animal having a disease or condition
CC   associated with polo-like kinase comprising administering to the animal a
CC   therapeutic or prophylactic amount of (I) so that expression of polo-like
CC   kinase is inhibited; and (4) screening for an antisense compound
CC   comprising contacting a preferred target region of a nucleic acid
CC   molecule encoding polo-like kinase with one or more candidate antisense
CC   compounds comprising at least an 8-nucleobase portion which is
CC   complementary to the preferred target region, and selecting for one or
CC   more candidate antisense compounds which inhibits the expression of a
CC   nucleic acid molecule encoding polo-like kinase. (I) has cytostatic,
CC   antiinflammatory and antimicrobial activities, and can be used in
CC   antisense gene therapy, and as a kinase inhibitor. The antisense
CC   oligonucleotides or compounds (I) can be used for inhibiting the
CC   expression of polo-like kinase, and for treating diseases or conditions
CC   associated with aberrant expression of polo-like kinase, e.g.
CC   hyperproliferative disorder such as cancer, including non-small cell lung
CC   cancer or oesophageal cancer. The antisense compounds are also useful as
CC   research reagents and kits, or in diagnostic, therapeutic and
CC   prophylactic applications, e.g. to prevent or delay infection,
CC   inflammation or tumour formation. The present sequence represents a human
CC   polo-like kinase chimeric phosphorothioate antisense oligonucleotide,
CC   which is used in an example from the present invention.

PT   New antisense oligonucleotides targeted to a nucleic acid encoding liver
PT   related homologue-1 (LRH1), useful for treating breast cancer,
PT   dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
XX
PS   Example 15; SEQ ID NO 3415; 909pp; English.
XX
CC   This invention relates to novel antisense compounds useful for modulating
CC   the expression of liver related homologue-1 (LRH1) and splice variants
CC   thereof. Specifically, it refers to compositions 8-30 nucleobases in
CC   length that target a portion of an active site on the nucleic acid
CC   molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan
CC   nuclear receptor protein that functions as a tissue specific
CC   transcription factor. The present invention describes antisense
CC   oligonucleotides that comprise at least one modified internucleoside
CC   linkage, a phosphorothioate linkage; at least one modified sugar moiety,
CC   a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-
CC   methylcytidine. These antisense compounds are useful for treating or
CC   diagnosing a disease associated with LRH1, such as breast cancer,
CC   dyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), high
CC   LDL (low density lipoprotein), hypercholesterolaemia, gall stones,
CC   triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic
CC   hepatitis, as well as hepatocellular carcinoma or a condition associated
CC   with aromatase activity. Accordingly, these compositions exhibit
CC   cytostatic, antilipaemic, antiarteriosclerotic, anorectic, hepatotropic,
CC   litholytic, antiinflammatory and virucidal activities. This
CC   oligonucleotide sequence is an antisense DNA oligo used to modulate the
CC   expression of the human LRH1 protein of the invention.

PT   New compounds, particularly antisense oligonucleotides targeted to a
PT   nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase
PT   (GFAT), for treating diabetes, a cardiovascular or neurologic disorder,
PT   ischemia/reperfusion injury.
XX
PS   Claim 4; SEQ ID NO 2602; 175pp; English.
XX
CC   The present invention relates to a compound which specifically hybridizes
CC   with a nucleic acid molecule encoding GFAT, and inhibits the expression
CC   of GFAT. Specifically claimed are antisense oligonucleotides capable of
CC   modulating the expression of GFAT, and which comprise any of the 3063
CC   sequences of 20 base pairs, given in the specification. The compound,
CC   composition and methods are useful for treating a disease or condition
CC   associated with GFAT, such as a disease or condition, e.g. diabetes, a
CC   cardiovascular or neurological disorder, ischemia/reperfusion injury.
CC   They are also useful in research and diagnostics for modulating the
CC   expression of GFAT. The present sequence represents a chimeric
CC   phosphorothioate oligonucleotide with 2'-MOE wings and a deoxy gap, these
CC   oligonucleotides inhibit human GFAT expression.

PT   New compounds, particularly antisense oligonucleotides targeted to a
PT   nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase
PT   (GFAT), for treating diabetes, a cardiovascular or neurologic disorder,
PT   ischemia/reperfusion injury.
XX
PS   Claim 4; SEQ ID NO 2305; 175pp; English.
XX
CC   The present invention relates to a compound which specifically hybridizes
CC   with a nucleic acid molecule encoding GFAT, and inhibits the expression
CC   of GFAT. Specifically claimed are antisense oligonucleotides capable of
CC   modulating the expression of GFAT, and which comprise any of the 3063
CC   sequences of 20 base pairs, given in the specification. The compound,
CC   composition and methods are useful for treating a disease or condition
CC   associated with GFAT, such as a disease or condition, e.g. diabetes, a
CC   cardiovascular or neurological disorder, ischemia/reperfusion injury.
CC   They are also useful in research and diagnostics for modulating the
CC   expression of GFAT. The present sequence represents a chimeric
CC   phosphorothioate oligonucleotide with 2'-MOE wings and a deoxy gap, these
CC   oligonucleotides inhibit human GFAT expression.

PT   New isolated polynucleotide encoding a Na+-coupled citrate transporter
PT   (NaCT) polypeptide, useful as a drug target for the treatment of obesity,
PT   hyperlipidemia, and hypercholesterolemia.
XX
PS   Example 3; SEQ ID NO 19; 186pp; English.
XX
CC   The invention relates to novel Na+-coupled citrate transporter proteins
CC   and their encoding genes. Inhibitors of transmembrane citrate
CC   transporters are useful for extending the lifespan, reducing weight,
CC   preventing weight gain or lowering blood cholesterol, triglyceride, LDL
CC   or glucose levels in a subject. The NaCT polypeptide is useful as a drug
CC   target for the treatment of obesity, hyperlipidemia, and
CC   hypercholesterolemia. This sequence corresponds to a PCR primer to
CC   amplify the human gene encoding an Na+-coupled citrate transporter
CC   protein.

PT   DNA-based human leukocyte antigen class I gene typing method - useful for
PT   tissue matching and prevention of graft versus host disease.
XX
PS   Disclosure; Page 10; 89pp; English.
XX
CC   AAV02716-V02738 are hybridisation probes used in a novel method for
CC   testing tissue samples to determine the allelic type of a human leukocyte
CC   antigen (HLA) class I gene in the sample. The HLA Class I gene is
CC   selected from among HLA-A, -B and -C genes. The method comprises of
CC   treating the tissue sample to obtain nucleic acid polymers suitable for
CC   amplification then combining these polymers with a first primer which
CC   hybridises with a portion of intron 1 or intron 3 of the HLA Class I gene
CC   and a second primer which hybridises with a different portion of the HLA
CC   Class I gene under conditions suitable for amplification to obtain an
CC   amplified product. The product is then evaluated to determine the allelic
CC   type of the HLA-Class I gene. The method is useful for tissue matching
CC   HLA class I antigens between donors and recipients and hence for
CC   preventing graft versus host disease

PT   Detecting inherited pre-disposition to cancer, specifically melanoma -
PT   from presence of mutation in gene for cyclin-dependent kinase 4,
PT   particularly one preventing binding of natural inhibitor p16.
XX
PS   Example; Col 7; 14pp; English.
XX
CC   This sequence represents a primer for an exon of the human cyclin-
CC   dependant kinase 4 (CDK4) gene. This sequence can be used in the method
CC   of the invention for detecting inherited predisposition to cancer by
CC   analysing the germ line genomic DNA for presence of a CDK4 allele that
CC   includes a predisposing mutation. The method is specifically used to
CC   determine predisposition to familial melanoma, indicated by replacement
CC   of R by C at amino acid 24 of CDK4. Many other tumours may also involve
CC   alterations in the control of CDK4, e.g. lymphomas, leukaemias, Ewing's
CC   sarcoma, Wilms tumour and non-small cell lung cancer

PT   Diagnosis of genetic variation associated with diseases involving TNF
PT   alpha - such as rheumatoid arthritis or diabetes, by detecting mutation
PT   at positions 857, 863 or 1031 of the TNF alpha gene.
XX
PS   Example 4; Page 10; 34pp; Japanese.
XX
CC   The present sequence represents a probe for the human tumour necrosis
CC   factor alpha (TNF-alpha) 5'-flanking region. The present invention
CC   describes genetic variations involved in diseases associated with TNF-
CC   alpha which are screened for by detecting the presence or absence of one
CC   or more of the following mutations in the 5'-flanking region of the human
CC   TNF-alpha gene: (1) T in place of C at position -857; (2) A instead of C
CC   at -863; and (3) C instead of T at -1031 (positions 373, 367 and 199
CC   respectively of the sequence given in AAX18575). The mutations increase
CC   TNF-alpha production in the cells involved. A suitable method for
CC   detection of these mutations is allele-specific oligonucleotide
CC   hybridisation (ASOH). TNF-alpha genetic variations associated with TNF
CC   alpha-implicated diseases such as juvenile rheumatoid arthritis, chronic
CC   rheumatoid arthritis, insulin-dependent diabetes or insulin-independent
CC   diabetes

PT   Diagnosis of genetic variation associated with diseases involving TNF
PT   alpha - such as juvenile rheumatoid arthritis, by detecting mutation at
PT   positions 857, 863 or 1031 of the TNF alpha gene.
XX
PS   Example 4; Page 10; 46pp; Japanese.
XX
CC   The present sequence represents a probe for the human tumour necrosis
CC   factor alpha (TNF-alpha) 5'-flanking region. The present invention
CC   describes genetic variations involved in diseases associated with TNF-
CC   alpha which are screened for by detecting the presence or absence of one
CC   or more of the following mutations in the 5'-flanking region of the human
CC   TNF-alpha gene: (1) T in place of C at position -857; (2) A instead of C
CC   at -863; and (3) C instead of T at -1031 (positions 373, 367 and 199
CC   respectively of the sequence given in AAX18584). The mutations increase
CC   TNF-alpha production in the cells involved. A suitable method for
CC   detection of these mutations is allele-specific oligonucleotide
CC   hybridisation (ASOH). TNF-alpha genetic variations associated with TNF
CC   alpha-implicated diseases such as juvenile rheumatoid arthritis, chronic
CC   rheumatoid arthritis, insulin-dependent diabetes or insulin-independent
CC   diabetes

PT   Antisense oligonucleotides targeted to nucleic acids encoding human tumor
PT   necrosis factor receptor-associated factor (TRAF), useful for treating
PT   diseases associated with TRAF expression such as inflammatory diseases.
XX
PS   Example 21; Page 66; 170pp; English.
XX
CC   The present invention relates to antisense oligonucleotides (see AAA55496
CC   -A55757) which are targeted to nucleic acids encoding a human tumour
CC   necrosis factor receptor-associated factor (TRAF). The antisense
CC   sequences comprise at least one modified internucleotide linkage, which
CC   is a phosphorothioate linkage. The oligonucleotides also include at least
CC   one modified sugar moiety such as a 2'-O-methoxyethyl sugar moiety.
CC   Sequences AAA55490-A55495 represent nucleotide sequences encoding human
CC   TRAF1-6. Included in the invention is a method for treating a human
CC   having a disease associated with the expression of TRAF comprising
CC   administering an antisense oligonucleotide. The reduction of jun kinase
CC   activation in cells comprises contacting the cells with an antisense
CC   oligonucleotide targeted to TRAF-6. A method for the reduction of E-
CC   selectin expression in cells or tissues comprises contacting the cells or
CC   tissues with an antisense oligonucleotide targeted to TRAF-2 or TRAF-6.
CC   The antisense oligonucleotides have antiproliferative and anti-
CC   inflammatory activity and are useful for treating disorders associated
CC   with cell proliferation and inflammation. The antisense oligonucleotides
CC   may also be used as a diagnostic probe for studying gene function

PT   New antisense compounds useful for treating, preventing or diagnosing
PT   e.g. tumors or inflammation, are targeted to the human dual specificity
PT   protein phosphatase (PTEN) sequence.
XX
PS   Claim 3; Col 41; 32pp; English.
XX
CC   The present invention describes phosphorothioate antisense
CC   oligonucleotides that are targeted to the 3'-untranslated region (UTR) of
CC   the sequence encoding a human dual specificity protein phosphatase
CC   designated PTEN (also known as MMAC1 and TEP1), and hybridise
CC   specifically to the human PTEN nucleotide sequence given in AAZ91361. The
CC   antisense oligonucleotides have anticancer, anti-inflammatory and anti-
CC   infective activities. The phosphorothioate antisense oligonucleotides can
CC   be used for diagnosis, treatment and prevention of PTEN-related diseases,
CC   e.g. infections, inflammation and tumours. The present sequence
CC   represents a phosphorothioate antisense oligonucleotide for human PTEN,
CC   from the present invention

PT   Testing a tissue sample to determine the allelic type of a human
PT   leukocyte antigen class I gene comprises amplification of nucleic acid
```

```
PT   polymers with primers which flank a region including an allelic variation
PT   of the HLA class I gene.
XX
PS   Disclosure; Col 8; 90pp; English.
XX
CC   The invention relates to a method (I) for testing a tissue sample to
CC   determine the allelic type of a human leukocyte antigen (HLA) class I
CC   gene in the sample, where the HLA class I gene is selected from HLA-A,
CC   HLA-B or HLA-C, by: (a) treating the tissue sample to obtain nucleic acid
CC   polymers suitable for amplification; (b) combining the nucleic acid
CC   polymers with a primer which hybridizes with a portion of intron 1 or
CC   intron 3 of the HLA class I gene, and a second primer which hybridizes
CC   with a different portion of the HLA class I gene and performing
CC   amplification, where the primers flank a region including at least one
CC   site of allelic variation in at least one of exons 2 or 3 of the HLA
CC   class I gene and where the first primer is a locus specific primer which
CC   hybridizes with intron 1 or 3 of only one of the HLA class I genes; and
CC   (c) evaluating the amplified product to determine the allelic type of the
CC   HLA class I gene. The method is useful for testing a tissue sample to
CC   determine the allelic type of a classical or non-classical HLA class I
CC   gene in the sample. The sequences AAA11039-A11122 represent consensus
CC   sequences of introns and exons of the HLA genes and primers and probes
CC   used to isolate and analyse the HLA genes

PT   New antisense oligonucleotides for modulating the expression of inducible
PT   nitric oxide synthase in cells or tissues, particularly useful for
PT   treating e.g. immunological, cardiovascular or neurological disorders, or
PT   ischemia.
XX
PS   Example 15; Page 85; 144pp; English.
XX
CC   The invention relates to antisense compounds, especially
CC   oligonucleotides, which are targeted to a nucleic acid encoding inducible
CC   nitric oxide synthase and which specifically hybridise to and modulate
CC   expression of inducible nitric oxide synthase. The antisense compounds
CC   have immunomodulator, antidiabetic, cardiovascular, cardiant,
CC   neuroprotective, disorder and vasotropic activity. The antisense
CC   oligonucleotides are useful for inhibiting the expression of inducible
CC   nitric oxide synthase in cells or tissues. In particular, the antisense
CC   oligonucleotides are useful for treating diseases or disorders associated
CC   with inducible nitric oxide synthase, e.g. diabetes, immunological
CC   disorder, cardiovascular disorder, neurological disorder or
CC   ischaemia/reperfusion injury. The antisense oligonucleotides are also
CC   useful for research and diagnostics. The present sequence is that of an
CC   antisense 2'-O-methoxyethyl gapmer oligonucleotide with a
CC   phosphorothioate backbone, a central "gap" region of ten nucleotides
CC   flanked by four nucleotide 2'-MOE (2'-methoxyethyl) wings and 5-
CC   methylcytidine residues throughout the oligonucleotide. The antisense
CC   olignucleotide is targeted to human inducible nitric oxide synthase (NOS)
CC   mRNA (AAH47973)

PT   Evaluating risk of unexplained recurrent pregnancy loss in a subject, by
PT   testing presence of a variant in interleukin-1 beta promoter region
PT   and/or in CD46 gene intron 1 region in a sample obtained from the
PT   subject.
XX
PS   Example 1; Page 21; 57pp; English.
XX
CC   The invention relates to a method for evaluating and treating risk of
CC   unexplained recurrent pregnancy loss (URPL) in a subject suspected of
CC   having immunologic reproductive failure. The method involves testing a
CC   sample obtained from the subject for the presence of a variant in the
CC   human interleukin-1beta (IL-1beta) promoter region, and/or a variant in
CC   the CD46 gene intron 1 region, where the presence of the variant,
CC   indicates an elevated risk of developing recurrent pregnancy loss. The
CC   present sequence is human tumour necrosis factor a (TNFA) promoter
CC   polymorphism analysing sequence specific oligonucleotide probe (SSOP)
CC   used in the exemplification of the invention

PT   New compound, preferably an antisense oligonucleotide, that hybridizes
PT   and inhibits the expression of phosphoinositide phosphatase (PTEN), for
PT   treating diseases such as diabetes, or a hyperproliferative condition.
XX
PS   Claim 7; Page 36; 39pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of phosphoinositide phosphatase (PTEN). The
CC   antisense compound is used to inhibit the expression of PTEN in cells or
CC   tissues, preferably human, or rodent, such as mouse or rat, liver, kidney
CC   or adipose cells or tissues. It is used to treat a disease or condition
CC   associated with PTEN, such as a metabolic disease or condition,
CC   preferably diabetes, especially Type 2 diabetes, or a hyperproliferative
CC   condition. It is also used to decrease blood glucose or insulin levels in
CC   an animal, preferably a diabetic human or rodent. It is also used to
CC   inhibit expression of PEPCK in cells or tissues. It is also used to
CC   decrease insulin resistance, or increase insulin sensitivity, in an
CC   animal, preferably a diabetic human or rodent. It is used to decrease
CC   blood triglyceride or cholesterol levels in an animal, preferably a
CC   diabetic human or rodent. It is also used in antisense gene therapy. The
CC   present sequence is an antisense oligonucleotide targetted to human PTEN
CC   DNA

PT   New DNA sequence isolated from potato encodes a protein which confers
PT   Phytophthora infestans resistance on plants and is useful to generate
PT   transgenic plants particularly potatoes and tomatoes with Phytophthora
PT   resistance.
XX
PS   Disclosure; Page 4; 41pp; English.
XX
CC   The present invention relates to a DNA sequence encoding a fragment of
CC   the Solanum tuberosum protein kinase (StPK-B, ABN83351). ABN83351 is part
CC   of the StPK-B gene, and encodes the protein kinase domain, but lacks the
CC   N-terminal portion of the gene including the translation start.
CC   Transposon tagging using the Ds transposon was used to isolate ABN83351.
CC   StPK-B confers Phytophthora infestans resistance on plants, specifically
CC   potatoes, and can be used for generating transgenic plants, particularly
CC   Solenaceae, which are resistant to Phytophthora species. The present
CC   sequence is a PCR primer, used to illustrate the invention

CC The invention relates to antisense compounds, compositions and methods
CC for modulating the expression of PTEN (also known as MMAC1 and TEP1). The
CC compound is useful for inhibiting the expression of PTEN in cells or
CC tissues to treat diseases associated with their expression, e.g.
CC metabolic diseases or conditions, type 2 diabetes or hyperproliferative
CC conditions. In addition, the compound is used for diagnostics,
CC prophylaxis, or as research reagents or kits. The invention is useful in
CC gene therapy. The present sequence is human PTEN DNA specific antisense
CC oligonucleotide.

PT Detecting methylation of 5' and promoter region of DD3 gene for
PT diagnosing proliferative disorders comprising contacting target nucleic
PT acid with a reagent that distinguishes between methylated and non-
PT methylated CpG dinucleotide.
XX
PS Claim 6; SEQ ID NO 55; 56pp; English.
XX
CC The present invention relates to detecting the methylation state of the
CC 5' and promoter region of the gene DD3 within a subject comprising
CC contacting a target nucleic acid having one or more sequences selected
CC from 5 3581 base pair sequences in a biological sample with at least one
CC reagent or a series of reagents. The method is useful for detecting the
CC methylation state of the 5' and promoter region of the gene DD3 within a
CC subject. The set of oligonucleotides comprising at least three of the
CC oligomers is useful for detecting the cytosine methylation state and/or
CC single nucleotide polymorphisms (SNPs) within SEQ. ID NO. 1-5 and its
CC complementary sequences. The set of oligomers is also useful for
CC detecting the methylation state of all CpG dinucleotides within SEQ ID
CC NO. 1 and its complementary sequences. The set of at least two
CC oligonucleotides can be used as primer oligonucleotides for the
CC amplification of DNA sequences selected from SEQ ID NO. 1-5 and its
CC complementary sequences. The DNA- and/or PNA-array is useful for
CC analyzing diseases associated with the methylation state of the gene DD3
CC comprising at least one nucleic acid. The methods, nucleic acids,
CC oligonucleotide or PNA-oligomer, kit, array or the set of
CC oligonucleotides is useful for the characterization, classification,
CC differentiation, grading, staging, and/or diagnosis of cell proliferative
CC disorders, or the predisposition to cell proliferative disorders. It can
CC also be used for the therapy of cell proliferative disorders. The present
CC sequence represents a detection oligonucleotide of the invention.

PT Poly:nucleotide(s) for identification of mutation(s) in Von Hippel-Lindau
PT tumour suppressor gene - and hierarchical test system utilising them,
PT useful for detecting tumours.
XX
PS Claim 1; Page 27; 51pp; English.
XX
CC PCR primers AAT75107-14 and AAT75124-26 are novel oligonucleotides that
CC are used for the identification of mutations in the von Hippel-Lindau
CC (VHL) tumour suppressor gene. The oligonucleotides can be used for the
CC identification and diagnosis of insertion/deletion mutations and for copy
CC number mutations. The primers are designed to hybridise to genomic DNA,
CC particularly in the flanking intron regions adjacent to the exons of the
CC VHL tumour suppressor gene. The present 5' primer hybridises to the
CC intron sequence 5' of exon 2. The oligonucleotides are used in a
CC hierarchical system of assays, which comprise a first assay providing a
CC highly specific test for the disease associated mutation, and a final
CC assay providing a highly sensitive and highly specific test for the
CC disease associated mutation. In the first assay exons of VHL tumour
CC suppressor gene are amplified using the above primers. If no mutations
CC are detected i.e. the result is negative, the sample is examined for
CC point mutations in the DNA sequence by sequencing (AAT75115-22, T751127-
CC 29). The major advantage of the hierarchical system used in this test is
CC the ability to dramatically reduce the per sample cost of targeted

PT   New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves
PT   RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1,
PT   PCNA and Cyclin B1.
XX
PS   Disclosure; Page 75; 109pp; English.
XX
CC   The present invention relates to a hairpin or hammerhead ribozyme,
CC   designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase
CC   other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
CC   Representative examples of ribozyme recognition sites are given in
CC   AAA82415 to AAA86787. The ribozyme of the invention is useful for
CC   inhibiting restenosis by introduction of the ribozyme into cells. The
CC   ribozyme is resistant to endonuclease activity and hence is efficient in
CC   restenosis treatment

PT   New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves
PT   RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1,
PT   PCNA and Cyclin B1.
XX
PS   Disclosure; Page 80; 109pp; English.
XX
CC   The present invention relates to a hairpin or hammerhead ribozyme,
CC   designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase
CC   other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
CC   Representative examples of ribozyme recognition sites are given in
CC   AAA82415 to AAA86787. The ribozyme of the invention is useful for
CC   inhibiting restenosis by introduction of the ribozyme into cells. The
CC   ribozyme is resistant to endonuclease activity and hence is efficient in
CC   restenosis treatment

PT Novel biallelic markers used to construct a high density disequilibrium
PT map of the human genome.
XX
PS Claim 8; Page 1199; 2745pp; English.
XX
CC AAZ65654 to AAZ69578 represent human biallelic markers from the present
CC invention, which contain a polymorphic base at position 24 of their
CC nucleotide sequences. AAZ69579 to AAZ77440 represent amplification
CC primers for the biallelic markers. The biallelic markers of the invention
CC have a variety of uses: they can be used for high density mapping of the
CC human genome, and in complex association studies and haplotyping studies
CC which are useful in determining the genetic basis for disease states.
CC Compositions and methods of the invention can also be useful for the
CC identification of the targets for the development of pharmaceutical
CC agents and diagnostic methods, as well as the characterisation of the
CC differential efficacious responses to and side effects from
CC pharmaceutical agents acting on a disease as well as other treatment.

PT Treating proliferative skin or eye diseases and scarring, using ribozymes
PT that cleave RNA encoding cytokines involved in inflammation, matrix
PT metalloproteinases, growth factors and cell-cycle dependent kinases.
XX
PS Example 1; Page 210; 408pp; English.
XX
CC The present invention describes a method for treating a proliferative
CC skin or eye disease and scarring. The method involves administering a
CC ribozyme (I) which cleaves RNA encoding a cytokine involved in
CC inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
CC dependent kinase, growth factor or a reductase, or administering a
CC nucleic acid molecule (II) comprising a promoter operably linked to a
CC nucleic acid segment encoding (I). (I) can have antipsoriatic,
CC dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,
CC ophthalmological, vulnerary, keratolytic and virucide activities, and
CC cleaves RNA encoding cytokine involved in inflammation. (I) can be used
CC in gene therapy. (I) and (II) are useful for treating proliferative skin
CC diseases such as psoriasis, atopic dermatitis, actinic keratosis,
CC squamous or basal cell carcinoma and viral or seborrheic wart. They can
CC also be used for treating proliferative eye diseases such as diabetic
CC retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
CC prematurity and retinal detachment, and for treating and preventing
CC scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
CC scar. AAH57577 to AAH62099 represent sequences used in the
CC exemplification of the present invention

PT   Collection of binding groups for determining or typing samples,
PT   especially clinical samples, has groups capable to identify essentially
PT   all members of the family of nucleic acids of relatively high
PT   significance.
XX
PS   Disclosure; Page 26; 166pp; English.
XX
CC   The present invention describes a collection of binding groups for a
CC   family of nucleic acids comprising members of relative high and relative
CC   low significance, where the binding groups are selected to be capable to
CC   identify, alone or in combination, essentially all members of the family
CC   of nucleic acids of relatively high significance. The collection of
CC   binding groups is useful for typing of nucleic acid in a clinical sample,
CC   by contacting the nucleic acid with the collection and determining
CC   whether one or more binding groups bound to the nucleic acid of the
CC   sample. This method is useful for determining whether the sample
CC   comprises at least a part of a member of relatively high significance of
CC   a family of nucleic acids. The collection of binding groups is useful for
CC   diagnosing the severity of a disease caused by a pathogen containing a
CC   member of a family of nucleic acids. ABL88779 to ABL89321 represent
CC   oligonucleotide sequences used in the exemplification of the present
CC   invention

PT   Isolated nucleic acid molecules having polymorphisms in known human genes
PT   e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers
PT   for locating, identifying and characterizing the genes responsible for
PT   disorder-related traits.
XX
PS   Example 22; Page 142; 714pp; English.
XX
CC   This invention relates to the sequence of an isolated nucleic acid
CC   molecule comprising at least one base variation from that of a known
CC   human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2),
CC   cytochrome P450 02E1 (CYP45002E1), adrenergic receptor beta1 (ADBR1),
CC   aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator
CC   (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding
CC   inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating
CC   protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl
CC   transferase (HNMT), (kallikrein 2) KLK2, nicotinamide -N-methyl
CC   transferase (NNMT), NADPH quinone oxidoreductase 2 (NQO2),
CC   sulfotransferase thermolabile (STM), UDP-glucuronosyl transferase 2B4
CC   (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl
CC   transferase (UGT2B15), urokinase receptor (uPA), multidrug resistance 1
CC   (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3
CC   (MRP3), orphan nuclear receptor (NR1I2), or acetylcholine muscarinic
CC   receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence.
CC   The polymorphisms in the human genes cited in the invention are useful as
CC   genetic linkage markers for locating and characterising the genes that
CC   are responsible for specific traits within the genome and eventually
CC   identifying the genes responsible for a variety of disorder-related
CC   traits as a result of their e.g., overexpression, constitutive
CC   expression, mutation or underexpression, which may be used in diagnosing
CC   and/or treating the disorders. The nucleic acid molecules comprising the
CC   polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1,
CC   ARNT, EPHX2, GST12, NNMT, NQO2, NR1I2, STM, UGT2B4, UGT2B7, UGT2B15, AHR,
CC   MDR1 and/or MDR3 are useful for screening individuals for altered drug
CC   metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2,
CC   AHR, MDR1 and/or MDR3 may also be used to screen individuals for
CC   susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are
CC   used to screen for altered cardiovascular function, in COX2 for altered
CC   susceptibility to colorectal tumours, in DBI or CHMR1 for altered central
CC   nervous system function, in FLAP and HNMT for altered pulmonary,
CC   immunological or haematological function, in KLK2 for altered serine
CC   protease activity in the prostate, in LTF for altered immunological or
CC   haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and
CC   peripheral nervous system function. The present sequence represents a
CC   sequencing primer used to sequence the polymorphic genes of the invention

PT   Analyzing a nucleic acid by cleaving the nucleic acid into multiple
PT   fragments at a defined sequence and selectively amplifying the fragments
PT   to produce a map by a modified HAPPY mapping technique.
XX
PS   Example; Page 23; 29pp; English.
XX
CC   The specification describes a method for nucleic acid analysis. The
CC   method comprises providing a HAPPY mapping panel comprising many nucleic
CC   acid samples, cleaving the nucleic acids in the samples to completion at
CC   a defined sequence to produce nucleic acid fragments, ligating a linker
CC   to the fragments, amplifying the nucleic acid using linker-specific
CC   primers and hybridizing specific probes to the sample. The method is
CC   useful for nucleic acid analysis and for determining the linkage phase
CC   between the alleles of two or more polymorphic DNA loci. The HAPPY
CC   mapping techniques may be applied to any mapping project, especially
CC   haplotyping and main applications of HAPPY mapping include genome and
CC   gene mapping, detection of strain diversity, population analysis,
CC   epidemiology, gene expression and the demonstration of phylogenetic and
CC   taxonomic relationships. PCR primers ABZ68440-41 were used to amplify a
CC   marker in the barley genome, in the course of the invention

```

```
CC   The present invention describes a short interfering nucleic acid (siNA)
CC   that downregulates expression of the SCD (stearoyl-CoA desaturase) gene
CC   by RNA interference. Also described: (1) modulating expression of SCD
CC   genes in cells, tissue explants or organisms by introduction of siNA; (2)
CC   kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or
CC   complexes of siNA; and (4) vectors that express siNA. SCD inhibiting
CC   siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and
CC   virucide activities. The siNAs can be used to modulate expression of SCD
CC   genes, in cells, tissue explants or organisms, e.g. for treating obesity;
CC   diabetes (types I and II); atherosclerosis; cancer and viral infections.
CC   They can also be used for drug screening; diagnosis; target
CC   identification and validation; genetic engineering; pharmacogenomics;
CC   studying gene function and gene mapping (e.g. of single-nucleotide
CC   polymorphisms). The present sequence represents an SCD siNA, which is
CC   used in the exemplification of the present invention.

CC This invention relates to novel short interfering nucleic acid (siNA)
CC molecules that downregulate expression of a protein tyrosine phosphatase-
CC 1B (PTP-1B) gene by RNA interference (RNAi). Specifically, the siNAs can
CC be short interfering RNA (siRNA), double-stranded RNA (dsRNA), micro-RNA
CC (miRNA) or short hairpin RNA (shRNA), all of which can mediate inhibition
CC of PTP-1B. The present invention describes sequence-specific post-
CC trancriptional gene silencing in animals using siNA molecules and
CC antisense oligonucleotides to modulate PTP-1B gene expression or
CC activity. Furthermore, these siNA molecules provide useful reagents for a
CC variety of therapeutic and diagnostic purposes, and as such can be used
CC for treating obesity, insulin resistance or diabetes (types I and II), as

```
CC   well as for drug screening, target identification and validation, genetic
CC   engineering, pharmacogenomics and for studying gene function and gene
CC   mapping (for example of single-nucleotide polymorphisms). Accordingly,
CC   these molecules exhibit anorectic and antidiabetic activities. This
CC   oligonucleotide sequence is a sense siNA molecule that targets human PTP-
CC   1B RNA of the invention.

PT   New double-stranded interfering nucleic acid, useful e.g. for treatment
PT   and diagnosis of leukemia and lymphoma, downregulates the breakpoint
PT   cluster region-Abelson (BCR-ABL) gene.
XX
PS   Example 7; SEQ ID NO 844; 197pp; English.
XX
CC   The invention relates to a novel double-stranded short interfering
CC   nucleic acid (siNA) that downregulates expression of the breakpoint
CC   cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1
CC   (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic
CC   activity and may be useful for modulating expression of the BCR-ABL gene,
CC   as well as for treating leukaemia or lymphoma and in diagnosis, drug
CC   screening, target identification and validation, genetic engineering,
CC   gene function studies and gene mapping. The current sequence is that of
CC   the human ABL1-targeted siRNA of the invention.

XX
PS   Example 3; SEQ ID NO 1097; 171pp; English.
XX
CC   The invention relates to short interfering nucleic acids (siNA) which
CC   downregulate expression of one or more human epidermal growth factor
CC   receptor (EGFR) genes (including HER1, HER2 HER3 and HER4) by RNA
CC   interference. The siNAs may or may not comprise ribonucleotides and may
CC   be double or single stranded. They further comprise sense and antisense
CC   regions, or alternatively are assembled from a sense oligonucleotide and
CC   an antisense oligonucleotide. Specifically, the siNAs include short
CC   interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short
CC   hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified,
CC   can contain deoxyribonucleotides, and can be chemically synthesised,
CC   expressed from a vector or enzymatically synthesised. The invention also
CC   relates to kits for the in vitro or in vivo delivery of siNA; conjugates
CC   and/or complexes of siNA; and vectors that express siNA. The siNAs are
CC   used to modulate expression of EGFR genes in cells, tissue explants or
CC   organisms (e.g., by ex vivo gene therapy), or in grafts and transplants
CC   for the treatment of a variety of conditions. They may be used for
CC   treating a wide range of cancers such as breast and ovarian cancer. The
CC   siNAs are also useful for drug screening, diagnosis, therapeutic target
CC   identification and validation, genetic engineering, pharmacogenomics,
```

PT   New short interfering nucleic acid, useful e.g. for treatment and
PT   diagnosis of cancers, downregulates expression of the multidrug
PT   resistance gene.
XX
PS   Example 3; SEQ ID NO 321; 143pp; English.
XX
CC   The present invention relates to short interfering nucleic acid (siNA)
CC   that downregulates expression of a multidrug resistance (MDR; P-
CC   glycoprotein) gene by RNA interference, modulating expression of MDR
CC   genes in cells, tissue explants or organisms by introduction of siNA;
CC   kits for in vitro or in vivo delivery of siNA; conjugates and/or
CC   complexes of siNA; and vectors that express siNA. The method relates to
CC   the modulation (inhibition) of expression or activity of MDR by RNA
CC   interference, siNA target mRNA, RNA splice variants, post-
CC   transcriptionally modified RNA, pre-RNA and/or RNA templates. siNA are
CC   used to modulate expression of MDR genes, in cells, tissue explants or
CC   organisms, e.g. for treating multidrug-resistant cancers but also for
CC   drug screening; diagnosis; target identification and validation; genetic
CC   engineering; pharmacogenomics; studying gene function and gene mapping
CC   (e.g. of single-nucleotide polymorphisms).The present sequence represents
CC   the lower strand of human MDR targeted double stranded siNA.

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Claim 7; Col 13-14; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. Clones containing the
CC   repeat sequences were isolated by hybridisation of chromosome-specific
CC   phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC   repeat blocks were isolated. The primers AAT65798-T66047 were used to PCR
CC   amplify the inserts from the isolated clones containing the repeat
CC   sequences. The primers AAT66012-3 were used to amplify the repeat
CC   sequence marker clone Mfd108 (AAT65779). (Updated on 25-MAR-2003 to
CC   correct PF field.)

PT   Anti-Fas recombinant antibodies - useful for treating auto-immune
PT   diseases, especially rheumatoid arthritis.
XX
PS   Example 4; Page 16; 72pp; English.
XX
CC   This sequence represents a primer for the coding sequence for the protein
CC   of the invention. The protein of the invention is a recombinant protein
CC   (A), that comprises at least one region corresponding to an
CC   immunoglobulin (Ig) variable region which enables the protein to
CC   recognise and specifically bind to an antigen, preferably human Fas, and
CC   has substantially no more immunogenicity in a human patient than a human
CC   antibody. The proteins are useful for treating autoimmune diseases,
CC   especially rheumatism (rheumatoid arthritis). (A) is based on a murine
CC   monoclonal antibody. As the protein lacks the constant region, it has
CC   substantially no more immunogenicity in the human patient than a human
CC   antibody

PT   Preparation of anti-sense nucleic acid - by assigning numerical value to
PT   target mRNA region and preparing new molecule with nucleic acid
PT   complementary to sequence with low value.
XX
PS   Example 3; Page 9; 19pp; Japanese.
XX
CC   The present sequence represents an antisense oligonucleotide for human
CC   derived vascular endothelial cell growth factor (VEGF), used in an
CC   example of the present invention. The present invention describes the
CC   preparation of an antisense nucleic acid (ANA). The method comprises: (a)
CC   using an mRNA sequence of varying regions in which a numerical value (NV)
CC   is assigned to a target region, where the size of NV depends on the
CC   possibility of forming a truly complementary double strand (DS) between
CC   two regions, and (b) preparing ANA with a nucleic acid containing a base
CC   sequence which is truly complementary to a sequence which has a low NV,
CC   where NV assigned to the ability to form DS is based on the difference of
CC   the complementary base sequence to the target. ANA can be used for the
CC   preparation of diagnostic and therapeutic agents. The method can easily
CC   predict ANA target site, therefore enabling easy and rapid preparation of
CC   ANA

PT   Identifying and characterizing cells by comparing the pattern of gene
PT   expression in a selected gene family.
XX
PS   Claim 4; Page 48; 102pp; English.
XX
CC   The invention provides a new method for identifying and characterising
CC   cells. The method for determining the genetic proximity of a first cell
CC   and a second cell comprises: (a) obtaining the first cell and the second
CC   cell; (b) determining in the first cell and the second cell the pattern
CC   of expression of genes in a selected gene family; and (c) calculating a
CC   proximity index using a specified formula. The methods can be used for
CC   characterising cells, e.g. for determining the origin of a cell, its
CC   genetic status, whether it carries a genetic defect, or whether it is
CC   transformed. They can be used for detecting a selected genetic defect in
CC   an individual, e.g. a fetus. They can also be used for determining the
CC   effect of a selected treatment on a test cell. They can also be used for
CC   obtaining cells capable of expressing an homeobox related desired
CC   property. The method uses reverse transcriptase polymerase chain reaction
CC   (RT-PCR) for determining the pattern of gene expression in a selected
CC   gene family. Sequences AAZ17803-Z18342 represent primers that can be used
CC   in the RT-PCR reactions to determine the pattern of gene expression. The
CC   gene family can be selected from a set of homeobox genes, kinase genes,
CC   protein phosphatase genes, P450 enzyme genes, steroid receptor

PT   New DNA methyltransferase nucleotide sequences - used particularly to
PT   develop antisense oligonucleotides for diagnostic and therapeutic
PT   purposes, particularly for inhibiting tumour growth.
XX
PS   Example 8; Page 32; 108pp; English.
XX
CC   PCR primers AAV99163-220 were used to map the intron boundaries of the
CC   exons of DNA methyltransferase (DNA MeTase) genomic sequence. Antisense
CC   oligonucleotides which inhibit inhibit DNA MeTase expression can be
CC   derived from the genomic DNA MeTase sequence. The antisense
CC   oligonucleotides can be used in investigating the role of DNA MeTase in
CC   cellular growth. They can be administered at different points in the cell
CC   cycle, or in conjugation with promoters or inhibitors of cell growth to
CC   determine the role of DNA MeTase in the growth of the cell type of
CC   interest. The antisense oligonucleotides can also be used for inhibiting
CC   tumour growth in a mammal, or to activate silenced genes to provide a
CC   missing gene function. This ameliorates disease symptoms, e.g. in beta
CC   thalassemia and sickle cell anemia. The antisense oligonucleotides can
CC   also be used an analytical and diagnostic tools and a potentiators of
CC   transgenic plant and animal studies

PT   Oligonucleotides targetted against nucleic acids encoding protein kinase
PT   C.
XX
PS   Example 15; Col 55-56; 56pp; English.
XX
CC   This invention describes novel oligonucleotides (AAX78524-X78644) having
CC   up to 50 nucleotides hybridisable with, and able to modulate the
CC   expression of, a nucleic acid encoding protein kinase C and its isozymes
CC   alpha, beta type I, beta type II, gamma, eta, delta, epsilon and zeta.
CC   The oligonucleotides of the invention have anti-inflammatory and
CC   cytostatic activity and are used for antisense targeting to modulate the
CC   expression of PKC or of a particular PKC isozyme or set of isozymes in
CC   cells or tissues. The products of the invention also hybridise with
CC   nucleic acids involved in the modulation of PKC expression, which is
CC   known to be involved growth control in hyperproliferative diseases e.g.
CC   colon cancer, glioblastoma and bladder cancer as well as in inflammatory
CC   conditions e.g. psoriasis. Due to their specificity the oligonucleotides
CC   are able to overcome the problems of toxicity associated with previous
CC   agents designed to modulate PKC expression

XX
PS   Disclosure; Page 1711; 1755pp; English.
XX
CC   PCR primers AAZ01426-Z06209 were used to amplify open reading frames
CC   (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs
CC   encode polypeptides (see AAY36754-Y37949) which can be used as vaccines
CC   against Chlamydia trachomatis. Antisense and ribozyme sequences can also
CC   be used to control growth of the microorganism. Chlamydia trachomatis is
CC   responsible for a large number of diseases, e.g. eye diseases such as
CC   conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion
CC   conjunctivitis; genital diseases such as nongonococcal uretritis,
CC   epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis;
CC   pneumopathy in breast feeding infants; and venereal lymphogranulomatosis.
CC   The polypeptides of the invention may be of use in treating these
CC   diseases

PT   New antisense oligonucleotides specific for human protein kinase C useful
PT   for diagnosis and treatment of cancer and psoriasis.
XX
PS   Claim 1; Col 21; 54pp; English.
XX
CC   The present invention describes a method of inhibiting the expression of
CC   human protein kinase C (PKC) in cells. The method comprises contacting
CC   the cells with an antisense oligonucleotide which has up to 50 nucleotide
CC   units. AAX83633 to AAX83720 represent specifically claimed antisense
CC   oligonucleotides for use in the method of the invention. The antisense
CC   oligonucleotides modulate hybridize to messenger RNA from the PKC gene
CC   which results in modulation of expression of the PKC gene. This means
CC   they can be used for diagnosis, therapeutic or prophylactic treatment of
CC   PKC associated diseases such as cancer and psoriasis, and as research
CC   agents. Abnormal proliferative states in tissue from patients suspected
CC   of having a hyperproliferative disease e.g. cancer, psoriasis can be
CC   diagnosed. Tumours associated with PKC can be distinguished from tumours
CC   which are not PKC associated to allow an efficacious treatment regime to
CC   be used. The antisense oligonucleotides have specific activity so are
CC   able to modulate PKC activity without producing side effects and with
CC   greater effectiveness than observed from administration of current
CC   agents. AAX83721 to AAX83753 represent other oligonucleotides used in
CC   examples from the present invention

XX
CC   AAX91991-X97517 represent PCR primers used to amplify open reading frames
CC   and other nucleic acid sequences from the genome of Chlamydia pneumoniae
CC   (see AAX91990). C. pneumoniae causes respiratory disease such as
CC   pneumonia and bronchitis and is thought to be a contributing factor in
CC   heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema
CC   nodosum or pharyngitis. The polypeptides encoded by the open reading
CC   frames of the C. pneumoniae genome (see AAY34584- AAY35879) can be used
CC   in immunogenic compositions as vaccines. Vectors containing C. pneumoniae
CC   nucleotides sequences can also be used as immunogenic compositions,
CC   especially where the vector directs the expression of a neutralising
CC   epitope of C. pneumoniae

PT DNA encoding protein functionally involved in the DNA mismatch repair
PT system of a plant.
XX
PS Example 3; Page 29; 117pp; English.
XX
CC The invention relates to the isolation of the Arabidopsis thaliana MSH3
CC (AAX79066) and MSH6 (AAX79067) genes. These genes are MutS homologues
CC (MSH) from plants and are involved in DNA mismatch repair. The DNA
CC sequence can be used in processes for at least partially inactivating a
CC DNA mismatch repair system of a plant, for increasing genetic variation
CC in a plant, and for obtaining a plant with a desired characteristic.
CC Primers AAX79105-X79160 represent 28 primer pairs used to amplify short
CC allelic repeat fragments designated Simple Sequence Length Polymorphisms
CC (SSLP). These fragments can be used as markers in the analysis of
CC homologous recombination between genomes of A.thaliana subspecies

PT New synthetic oligonucleotides inhibiting expression of protein kinase C
PT (PKC)-alpha - useful for treating and diagnosing conditions associated
PT with abnormal PKC expression.
XX
PS Example 15; Col 21; 56pp; English.
XX
CC The present invention specifically describes antisense oligonucleotides
CC of up to 50 nucleotides in length which specifically bind human protein
CC kinase C-alpha (PKC-alpha) mRNA. AAX19127 to AAX19247 represent antisense
CC oligonucleotides from the present invention which bind human PKC-alpha, -
CC beta, -gamma, -delta, -epsilon, -zeta and -eta. The antisense
CC oligonucleotides modulate the expression of the PKC gene (i.e. inhibit
CC the PKC gene). The antisense oligonucleotides can be used to diagnose
CC abnormal proliferative states in tissue or other samples from patients
CC suspected of having a hyperproliferative disease e.g cancer or psoriasis.
CC The antisense oligonucleotides can be used to distinguish PKC-associated
CC tumours and to detect and diagnose PKC expression (through the use of 32P
CC labeled antisense oligonucleotides). Radiolabeled antisense
CC oligonucleotides can also be used to perform autoradiography of tissues
CC to determine the localization, distribution and quantitation of PKC
CC expression for research, diagnostic and therapeutic purposes. The use of
CC the antisense oligonucleotides eliminate the side effects associated with
CC prior art methods because it modulates the amount of PKC protein made
CC from the gene rather than inhibiting the enzyme itself. (Updated on 20-
CC MAR-2003 to correct PF field.)

PT   Novel polynucleotides and polypeptides used to modulate a variety of
PT   cellular processes.
XX
PS   Disclosure; Page 22; 120pp; English.
XX
CC   PCR primers AAZ37136-Z37137 are used to amplify the TANGO 125 (T125) gene
CC   (AAZ37131). The T125 protein has two epidermal growth factor (EGF)-like
CC   domains at amino acids 107-134 and 141-176 and is predicted to have a
CC   molecular weight of approximately 30kD. T125 is predicted to have no
CC   transmembrane domains and appears to be a secreted protein. There are
CC   three alternatively spliced forms of T125: T125a, T125b and T125c
CC   (AAZ37132-Z37135). The sequences of all variants of T125 are used in the
CC   invention to create antibodies which selectively bind to T125. The T125
CC   polypeptide is used to modulate a variety of cellular processes. It can
CC   be used to produce fusion proteins. The protein may also be used to
CC   produce antibodies, and to identify T125 antagonists and agonists. The
CC   T125 polynucleotides, polypeptides, homologues and antibodies can be used
CC   in screening assays; predictive medicine; and methods of treatment of
CC   T125 associated disorders. The T125 polynucleotides can be used to
CC   express the protein; to detect T125 mRNA; to detect genetic alterations
CC   in the T125 gene; in forensic biology; and as a source of primers and
CC   probes

PT Anti-human Fas humanizing antibody-containing antirheumatic agents.
XX
PS Disclosure; Page 16; 109pp; Japanese.
XX
CC The present invention relates to antirheumatic agents which comprise as
CC active ingredients an immunoglobulin M (IgM) protein. The IgM protein
CC does not include a J segment, has apoptosis inducing activity, and
CC consists of a light and heavy chain polypeptide produced synthetically.
CC The agents of the invention exhibit antirheumatic and immunosuppressive
CC activity and can be used to treat autoimmune diseases, especially
CC rheumatism. The IgM molecule used in the invention has human Fas-antigen
CC binding properties. Included in the invention are nucleotide sequences of
CC the IgM light and heavy chains (see AAA78267-A78272) and the
CC corresponding protein sequences (see AAB12913-B12918 and AAB12919), and
CC nucleotide sequences of the humanised anti-human Fas Ig CH11 (see
CC AAA78202-A78206) and protein sequences (see AAB12908-B12910). Also
CC included are anti-human Fas antibody CDR peptides (AAB12902-B12907).
CC Primers specific for the anti-human Fas antibody, light, heavy and kappa
CC chains used in the invention are represented by sequences AAA78213-
CC A78266. Primers used for sequencing the human Ig DNA used in the
CC invention are represented by sequences AAA78277-A78318 and AAA78335-
CC A78337, while humanised anti-Fas Ig DNA sequencing primers are
CC represented by sequences AAA78321-A78334 and AAA78338-A78367. Primer
CC sequences AAA78207-A78212 are specific for murine Ig DNA, and are used in
CC the production of the agent of the invention

PT Human Dickkopf (hDkk) and Soggy nucleic acids and proteins, useful as
PT modulating agents in regulating cellular processes and particularly for
PT treating disorders characterized by aberrant expression or activity of
PT Dkk, e.g. Alzheimer's,.
XX
PS Example 2; Page 123; 208pp; English.
XX
CC PCR primers AAA75141-42 were used to amplify cDNA encoding a murine
CC Dickkopf (Dkk)-3 protein. The specification also describes Soggy (Dkk-
CC related) sequences. Dkk is a cysteine-rich secreted protein. The Dkk
CC nucleic acids and proteins are useful as modulating agents in regulating
CC cellular processes. They are particularly useful in treating subjects
CC having a disorder characterized by aberrant expression or activity of Dkk
CC such as optic disorders (glaucoma, conjunctivitis), brain disorders
CC (Alzheimer's disease, epilepsy, amnesia), inflammation, skeletal muscle
CC disorders, pulmonary disorders (Goodpasture's syndrome), cardiovascular
CC disorders, and hyperproliferative disorders (cancer). The Dkk proteins
CC and nucleic acids may also be used for research purposes, such as for
CC chromosome mapping, tissue typing and in screening assays to identify
CC modulators

PT   Novel antisense compounds targeting nucleic acid encoding groEL or groES
PT   gene of microorganism, which hybridize with and inhibit expression of the
PT   genes, useful to inhibit growth of microorganism having the genes.
XX
PS   Claim 3; Page 48; 110pp; English.
XX
CC   The present invention specifically claims AAH56368 to AAH56832 which are
CC   antisense oligonucleotides to nucleotide sequences encoding groE. More
CC   generally, antisense compounds (I) comprising antisense oligonucleotides
CC   of 5-50 bases targeted to a nucleotide sequence encoding groEL (heat
CC   shock protein (HSP)60) (GL) and groES (HSP10) (GS) gene from a
CC   microorganism, where the antisense compound is complementary to GL or GS
CC   of a microorganism and specifically hybridises with and inhibits the
CC   expression of GL or GS, is claimed. (I) have antibacterial, antiviral and
CC   antiproliferative activities, and can be used in antisense therapy and
CC   for inhibition of expression of groES or groEL. (I) are useful for
CC   inhibiting expression of GL or GS in cells or tissues in vitro. (I) are
CC   also useful for inhibiting the growth of a microorganism, or inhibiting
CC   the expression of GL or GS gene in a microorganism (a bacterial cell or a
CC   virus) having a GL or GS gene which involves administering to the
CC   microorganism or to a cell infected with the microorganism, (I). (I) are
CC   also useful for treating a mammalian pathological condition mediated by
CC   the microorganisms which involves identifying a eukaryotic organism
CC   having a pathological condition mediated by microorganisms having a GL or
CC   GS gene and administering (I) such that the growth of microorganism is
CC   inhibited. The antisense compounds are utilised for diagnostics,
CC   therapeutics, prophylaxis and as research reagents and kits, e.g., to
CC   prevent or delay microbial infections in humans. They are also useful as
CC   molecular weight markers. AAH56362 to AAH56367 and AAH56833 to AAH56854
CC   represent PCR primers for groE sequences which are used in the
CC   exemplification of the present invention. AAH56855 to AAH56870 represent

PT   Producing neuroectoderm cells for treatment of Parkinson's and
PT   Alzheimer's and for transplantation comprises culturing early primitive
PT   ectoderm-like cells in conditioned medium.
XX
PS   Example 3; Page 42; 91pp; English.
XX
CC   This sequence represents a PCR primer for the Nkx2.2 gene, used within
CC   the scope of the invention. The invention relates to a method for
CC   producing neuroectoderm cells (I) comprises: (a) providing a source of
CC   early primitive ectoderm-like (EPL) cells and a neural-inducing
CC   conditioned medium (CM) or extract of it; and (b) contacting the EPL
CC   cells with the CM or extract for a time sufficient to generate controlled
CC   differentiation to (I). The cells or partially differentiated progeny are
CC   useful in human, or animal cell therapy, transgenic animal production,
CC   human or animal gene therapy, the screening of pharmaceutical that induce
CC   a biological response in neuroectoderm cells or their partially
CC   differentiated progeny and evaluation of biological molecules that direct
CC   differentiation of neural cells. The method is useful for producing
CC   neuroectoderm cells. It is also useful for producing differentiated or
CC   partially differentiated cells from neural ectoderm cells. The method can
CC   is also useful for maintaining neuroectoderm cells in vitro in
CC   homogeneous cell populations. It can also be used for producing
CC   genetically modified neuroectoderm cells. The cells can be used in the
CC   treatment of neuronal diseases, including Parkinson's disease,
CC   Huntington's disease, lysosomal storage diseases, multiple sclerosis,
CC   memory and behavioural disorders, and Alzheimer's disease. The method can
```

```
CC   also be used for preparation of tissue or organs for transplant. Neural
CC   crest cells produced by the method are useful for the treatment of spinal
CC   cord disorders and Schwann cells produced by the method are used for the
CC   treatment of multiple sclerosis

PT   Antisense oligonucleotide for modulating human protein kinase C-delta and
PT   treating diseases such as cancer, diabetes, comprises nucleotides
PT   specifically hybridizable with nucleic acid encoding the protein kinase.
XX
PS   Claim 6; Page 48; 84pp; English.
XX
CC   The invention provides antisense oligonucleotides that specifically
CC   hybridize with human protein kinase C-delta (PKC-delta) polynucleotide.
CC   The antisense oligonucleotides are useful for modulating the expression
CC   of human PKC-delta in cells or tissues, especially adipose tissues which
CC   express human PKC-delta, for inhibiting hyperproliferation of cells and
CC   treating or preventing an abnormal proliferative condition such as
CC   hyperproliferative disorder, especially psoriasis or cancer such as
CC   leukemia. They are also useful for reducing an inflammatory response of
CC   human cells and treating an animal having a disease or condition
CC   associated with tumour necrosis factor-alpha (TNF-alpha), especially
CC   overexpression of TNF-alpha, such as inflammatory or autoimmune disease
CC   or a condition which is infectious, diabetes, inflammatory bowel disease,
CC   multiple sclerosis, pancreatitis, rheumatoid arthritis, hepatitis, atopic
CC   dermatitis or allograft rejection and for reducing the blood glucose
CC   level in a human. Sequences AAC84223-240 represent antisense
CC   oligonucleotides for inhibiting human PKC-delta mRNA

PT   Composition for treating inflammatory and autoimmune diseases, comprises
PT   antisense compound targeted to nucleic acid molecule encoding integrin
PT   alpha4 and inhibit expression of integrin alpha4.
XX
PS   Claim 12; Col 49; 49pp; English.
XX
CC   The sequence is an antisense oligonucleotide targetting human integrin 4,
CC   a protein involved in autoimmune and inflammatory diseases. The invention
CC   relates to antisense inhibitors of integrin alpha 4 which target and
CC   inhibit expression of integrin alpha 4. The antisense molecules are
CC   useful for inhibiting the expression of integrin alpha4 in human cells or
CC   tissues, treating an animal having a disease or condition associated with
```

```
CC   expression of integrin alpha4, e.g., inflammatory disease or condition,
CC   autoimmune disease or condition including rheumatoid arthritis, multiple
CC   sclerosis and tumour metastases, melanoma, asthma, psoriasis, allergy,
CC   Grave's disease, Hashimoto's thyroiditis, systemic lupus erythematosus
CC   and allograft rejection, and diseases or conditions characterised by
CC   leukocyte migration into affected tissues, preferably central nervous
CC   system tissues. The antisense molecules are also useful for reducing the
CC   levels of VLA-4 and alpha4beta7 integrin in human cells or tissues, and
CC   reducing the adherence of cells of a first type e.g., melanoma cells or
CC   lymphocytes, to cells of a second type e.g., endothelial cells, by
CC   inhibiting integrin alpha4 expression and thus decreasing adhesion of
CC   cells

PT   Novel isolated Fanconi anemia protein complex polypeptide, termed FANCD2,
PT   useful for treating Fanconi anemia pathway defect in cell target or for
PT   treating patient with defective FANCD2 gene.
XX
PS   Claim 8; Page 55; 103pp; English.
XX
CC   The invention relates to an isolated Fanconi anaemia protein complex
CC   (FANCD2) polypeptide. The FANCD2 protein comprises a sequence of 1472
CC   amino acids fully defined in the specification, its 90% identical
CC   sequence, a sequence encoded by a polynucleotide that is at least 90%
CC   identical to sequences given in specification such as a 5127 base pair
CC   sequence, or a fragment which is at least 50 amino acids in length. The
CC   FANCD2 protein is useful for treating an FA pathway defect in a cell
CC   target or for treating a patient with a defective FANCD2 gene. The FANCD2
CC   gene is useful for making a recombinant expression vector. The FANCD2
CC   protein and its gene are useful as a novel target for therapeutic
CC   development, and in diagnostic test and screening assays for diseases
CC   associated with DNA repair and cell cycle abnormalities such as Fanconi
CC   anaemia, Bloom's syndrome, Cockayne's syndrome, Hereditary non-polyposis
CC   colon cancer, ataxia telangiectasia and Xeroderma pigmentosum. The FANCD2
CC   gene is useful in producing probes and primers for screening patients in
CC   genetic based test, for diagnosing Fanconi anaemia and cancer, for
CC   preparing an experimental mouse model for use in screening new
CC   therapeutics for treating conditions involving defective DNA repair, and
CC   in gene therapy methods. A recombinant vector containing the FANCD2 gene
CC   of the invention is useful in gene therapy. This polynucleotide sequence
CC   represents a PCR primer for amplifying a FANCD exon relating to the
CC   invention

PT Novel isolated polypeptide comprising variant form of mouse or human SAC1
PT polypeptide, and is associated with altered preference for carbohydrates
PT or other sweeteners, useful for preventing obesity, diabetes, alcoholism.
XX
PS Claim 14; Page 87; 239pp; English.
XX
CC The invention relates to an isolated polypeptide, comprising a variant
CC form of mouse or human SAC1 polypeptide. The variant form is associated
CC with altered preference for carbohydrates, other sweeteners or ethanol.
CC The polypeptide and its associated DNA sequence can be produced by
CC recombinant techniques and is useful for preventing obesity, diabetes or
CC alcoholism associated with SAC1 expression. The sequences are useful in
CC screening for drugs and sweeteners. Recombinant cell lines and transgenic
CC embryos may be used in screening for and identifying agents that induce
CC or repress function of SAC1. Predisposition to diabetes, obesity or
CC alcoholism can be ascertained by testing any fluid or tissue of a human
CC (such as blood, pancreas or tongue) for sequence variations of the SAC1
CC gene. A sequence variation of the SAC1 locus may indicate a
CC predisposition to diabetes, obesity and/or alcoholism and may provide a
CC diagnostic mark. The polynucleotide can be detected in a biological
CC sample by contacting the DNA with a probe to form a hybridisation complex
CC which is then detected. The sequences represent cDNA encoding human and
CC mouse SAC1 polypeptides and PCR primers specific for the SCA1 genes

PT New antisense oligonucleotide having nucleoside units which specifically
PT binds mRNA encoding human protein kinase C isoform, useful for treating
PT hyperproliferative and inflammatory diseases e.g. psoriasis, tumor and
PT cancer.
XX
PS Example 15; Col 47-48; 77pp; English.
XX
CC The invention comprises antisense oligonucleotides designed to bind mRNA
CC encoding a human protein kinase C (PKC) isoform (i.e. PKC-alpha, PKC-beta
CC type I, PKC-beta type II, PKC-gamma, PKC-delta, PKC-epsilon, PKC-zeta,
CC and PKC-eta). The antisense oligonucleotides of the invention are useful
CC for modulating the expression of the PKC isoforms. The antisense
CC oligonucleotides are useful for treating hyperproliferative conditions
CC (e.g. tumour, glioblastoma, bladder cancer, breast cancer, colon cancer
CC and lung cancer), and inflammatory conditions (e.g. psoriasis). The
CC antisense oligonucleotides of the invention are also useful for detection
CC and diagnosis of PKC expression. The present sequence represents a human
CC PKC antisense oligonucleotide of the invention. NOTE: The present
CC sequence contains a phosphorothioate backbone

CC   receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence.
CC   The polymorphisms in the human genes cited in the invention are useful as
CC   genetic linkage markers for locating and characterising the genes that
CC   are responsible for specific traits within the genome and eventually
CC   identifying the genes responsible for a variety of disorder-related
CC   traits as a result of their e.g., overexpression, constitutive
CC   expression, mutation or underexpression, which may be used in diagnosing
CC   and/or treating the disorders. The nucleic acid molecules comprising the
CC   polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1,
CC   ARNT, EPHX2, GST12, NNMT, NQO2, NR1I2, STM, UGT2B4, UGT2B7, UGT2B15, AHR,
CC   MDR1 and/or MDR3 are useful for screening individuals for altered drug
CC   metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2,
CC   AHR, MDR1 and/or MDR3 may also be used to screen individuals for
CC   susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are
CC   used to screen for altered cardiovascular function, in COX2 for altered
CC   susceptibility to colorectal tumours, in DBI or CHMR1 for altered central
CC   nervous system function, in FLAP and HNMT for altered pulmonary,
CC   immunological or haematological function, in KLK2 for altered serine
CC   protease activity in the prostate, in LTF for altered immunological or
CC   haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and
CC   peripheral nervous system function. The present sequence represents a PCR
CC   primer used to amplify the sequences of the invention

XX
CC   The invention relates to a method for identifying a molecule involved in
CC   lipid regulation comprising identifying a molecule that binds to or
CC   inhibits binding of a molecule to high bone mass (HBM) or its wild type
CC   gene, Zmax1. Compounds identified by the method are useful for treating,
CC   diagnosing, preventing or screening for normal and abnormal lipid-
CC   associated conditions, including arteriosclerosis, cardiovascular
CC   disease, stroke, and osteoporosis. The compounds may also be used in the
CC   treatment or prevention of diabetic atherosclerosis, neurovascular
CC   conditions caused by plaque build-up, poor circulation due to plaque
CC   build-up and associated poor wound healing. The methods may be used in
CC   gene therapy, pharmaceutical development, and diagnostic assays for bone
CC   development disorders. Molecules identified by comparison of Zmax1 and
CC   HBM systems can be used as surrogate markers in pharmaceutical
CC   development, in diagnosis of human or animal bone disease, and in the
CC   treatment of bone diseases. Sequences ABK22776-ABK23411 represent cDNA
CC   molecules encoding human Zmax1 and HBM, and PCR primers, probes, linkers
CC   and adapters of the invention

PT   Novel tumor suppressor gene encoding PTX1 protein, useful for identifying
PT   mutation in a nucleic acid sequence in a patient sample, and for use in
PT   the diagnosis, prognosis and treatment of cancer.
XX
PS   Example 1; Fig 9; 74pp; English.
XX
CC   The present invention relates to the isolation of a novel polynucleotide
CC   sequence encoding a human tumour suppressor protein termed PTX1. The PTX1
CC   gene maps to chromosome 12. The sequences of the invention can be used in
CC   the diagnosis, prognosis, and treatment of cancer, particularly prostate
CC   cancer. They are also useful as research tools to identify other tumour
CC   suppressor genes. The polynucleotide sequence is useful for identifying a
CC   mutation in a nucleic acid sequence in a patient sample. PTX1 molecules
CC   are useful for identification, detection and/or molecular
CC   characterisation of components involved in the regulation of cellular
CC   differentiation and tumourigenesis. ABK12359-ABK12384 represent the exon-
CC   intron junctions of the human PTX1 gene

CC   The invention relates to nucleic acids encoding a variety of proteins
CC   human T139 (TANGO-139), T125 (TANGO-125), T110 (TANGO-110), murine T175
```

```
CC   (TANGO-175), human T175 or murine WDNM-2, having diagnostic, preventive,
CC   therapeutic and other uses. Polypeptide of the invention has the ability
CC   to inhibit a proteinase activity, to modulate cell-cell interactions,
CC   haematopoiesis and the ability to modulate clotting. Polypeptide and
CC   polynucleotide of the invention are useful for diagnosing and treating
CC   disorder characterised by their aberrant expression or activity. The
CC   antibodies are useful as modulating agents in regulating a variety of
CC   cellular processes e.g. cell proliferation and/or cell differentiation.
CC   TANGO-139 is useful for treating kidney defects such as kidney failure,
CC   TANGO-125 is useful in wound healing and for treating cancer, TANGO-110
CC   is useful for treating neoplasia, TANGO-177 or WDNM-2 is useful for
CC   treating cancer, are useful to treat pancreatic disorders, such as
CC   pancreatitis, cerebrovascular disease, and tumours, and injury or trauma
CC   to the brain. TANG0-125, 110, 175 molecules treat heart disorders, e.g.,
CC   ischaemic heart disease, cardiovascular disorders, such as ischaemic
CC   heart disease. TANGO-139, 125, 110 and 175 molecules are useful to treat
CC   renal (kidney) disorders, such as glomerular disease (e.g., acute and
CC   chronic glomerulonephritis), TANGO-175 is useful to treat uterine
CC   disorders, hyperplasia of the endometrium. TANGO-110 is useful to treat
CC   spleen, e.g., the fetal spleen, associated diseases and disorder. TANGO-
CC   125 treats prostate disorders, such as inflammatory diseases, Crohn's
CC   disease and tumours. TANGO-139, 125, 110, 175 or WDNM-2 are useful for
CC   treating proliferative disorders, inflammatory disorders. TANGO-175, or
CC   WDNM-2 activity also include apoptotic disorders, rheumatoid arthritis,
CC   systemic lupus erythematosus, insulin-dependent diabetes mellitus, immune
CC   -related disorders, e.g., immunodeficiency disorders, viral disorders,
CC   cell growth disorders, e.g., cancers and inflammatory disorders and
CC   apoptotic disorders. The nucleic acids of the invention are used in gene
CC   therapy. The present sequence is a PCR primer used in the invention

PT   New antisense oligonucleotide which modulates expression of caspase 9,
PT   useful to treat tumor, inflammation or to prevent infection in humans.
XX
PS   Claim 26; Page 95; 145pp; English.
XX
CC   The present invention relates to a new antisense compound targeted to a
CC   nucleic acid molecule encoding caspase 9 (C9). The compound specifically
CC   hybridises with and inhibits the expression of caspase 9. The invention
CC   also describes an antisense compound that specifically hybridises with an
CC   8 nucleotide portion of an active site of the nucleic acid. The invention
CC   is useful for inhibiting the expression of C9 in cells or tissues and is
CC   also useful for treating an animal having a disease or condition
CC   associated with C9, including a hyperproliferative, haematopoietic or
CC   cholesterol disorder, bone metabolism disorder, stroke, brain injury or
CC   neurodegenerative disease. The compound is commonly useful as a research
CC   and diagnostics reagent. It is also useful to distinguish between
CC   functions of various members of a biological pathway. The invention is
CC   also be useful prophylactically e.g. to prevent or delay infection,
CC   inflammation or tumour formation. The antisense compound of the invention
CC   is often preferred over native form because of enhanced cellular uptake,
CC   enhanced affinity for nucleic acid target and increased stability in
CC   presence of nucleases. The present nucleic acid sequence represents one
CC   of a collection (ABK69249-ABK69396) of chimeric phosphorothioate
CC   oligonucleotides having 2'-methoxyethyl (2'-MOE) wings. This sequence was
CC   used in the methods of the invention for inhibition of caspase 9

PT   Determining the likelihood of tumor re-occurrence in a patient previously
PT   diagnosed with a breast tumor to determine treatment modalities,
PT   comprises analyzing the cell sample for loss of heterozygosity to
PT   chromosomal locus 3p24.3.
XX
PS   Example 1; Page 41; 42pp; English.
XX
CC   The invention relates to a method of determining the likelihood of tumour
CC   re-occurrence in a patient previously diagnosed with a breast tumour. The
CC   method involves analysing the target cell sample for loss of
CC   heterozygosity (LOH) to chromosomal locus 3p24.3. The method is useful
CC   for determining the likelihood of tumour re-occurrence in a patient
CC   previously diagnosed with a breast tumour and subsequently useful in
CC   determining the degree of aggressive treatment indicated. The prognostic
CC   method is especially useful in making decisions concerning treatment
CC   modalities, including therapeutic intervention, diagnostic criteria such
CC   as disease staging and disease monitoring and surveillance for metastasis
CC   or recurrence of neoplastic disease. The present sequence is a PCR primer
CC   used for LOH analysis. This primer is used to illustrate the method of
CC   the invention

PT   New gene encoding an aphidicolan-1,6beta-ol synthase protein for
PT   producing transformants to produce the DNA polymer alpha-specific
PT   inhibitor aphidicolin, applicable in e.g. drugs for controlling
PT   replication of eukaryotes.
XX
PS   Example 2; Page 17; 74pp; Japanese.
XX
CC   The present invention describes genes required in the production of
CC   aphidicolin, which is a DNA polymerase alpha-specific inhibitor which
CC   plays an important role in the replication of eukaryotes. Genes involved
CC   in an aphidicolin biosynthase cluster are: aphidicolan-1,6 beta-ol
CC   synthase; geranylgeranyl diphosphate (GGDP) synthase; cytochrome P450
CC   hydroxylase (P450-1); transporter protein (TP) and cytochrome P450
CC   hydroxylase (P450-2). The genes are used for constructing transformants
CC   to produce a DNA polymer alpha-specific inhibitor aphidicolin by
CC   fermentation, applicable in reagents and drugs for cell cycle problems
CC   during co-culturing or for controlling replication of eukaryotes. With
CC   the transformants, aphidicolin can be in produced in large quantities,
CC   and with high yield. The present sequence represents a PCR primer for
CC   GGDP synthase isolated from Phoma betae, which is used in an example from
CC   the present invention

PT New transgenic animals (e.g. mice), useful as models for studying bone
PT density modulation, developing drugs for treating or preventing bone
PT diseases (e.g. osteoporosis), or diagnosing diseases characterized by
PT reduced bone density.
XX
PS Disclosure; Page 58; 603pp; English.
XX
CC The invention relates to novel transgenic animals expressing the high
CC bone mass (HBM) gene, expressing the corresponding wild type HBM gene,
CC comprising an alteration of the gene encoding LRP5 or LRP6, or expressing
CC an LRP5 that is modulated by an altered gene control sequence introduced
CC by homologous or non-homologous recombination. The transgenic animals are
CC for the study of bone density modulation or bone mass modulation. The
CC invention has osteopathic and cytostatic activity. The polynucleotides of
CC the invention may have a use in gene therapy. The transgenic animals and
CC nucleic acids are for the study of bone density modulation, where the
CC bone mass is modulated relative to non-transgenic animals of the same
CC species in more than one parameter selected from bone density, bone
CC strength, trabecular number, bone size, or bone tissue connectivity. The
CC transgenic animals, nucleic acids and methods are useful for identifying
CC molecules involved in bone development, and for developing pharmaceutical
CC compositions, which may be employed for treating or preventing bone
CC diseases, e.g. osteoporosis, osteomalacia, rickets, Paget's disease, or
CC neoplasms of the bone. The transgenic animals and nucleic acids are also
CC useful in methods for diagnosing diseases involved in bone development,
CC or characterised by reduced bone density or mass. The present sequence is
CC used in the exemplification of the invention

PT New zebrafish embryo cell line, which becomes a germ cell when introduced
PT to a fish embryo, useful for making a germ line chimeric zebrafish, which
PT is a valuable model for genetic studies of human diseases.
XX
PS Example 3; Page 31; 45pp; English.
XX
CC The present invention describes a fish embryo cell line, where a cell of
CC the fish embryo cell line, after incubation in vitro for at least 24
CC hours, will become a germ cell when introduced to a fish embryo. Also
CC described: (1) making the fish embryo cell line; (2) an isolated fish
CC embryo cell line obtained by the method of (1); (3) making a germ line
CC chimeric fish; (4) a germ line chimeric fish obtained by the method of
CC (3); and (5) cell culture media comprising a growth factor and fish cell
CC conditioned medium, or a growth factor and a fish cell, where the growth
CC factor is fibroblast growth factor or epidermal growth factor. The fish
CC embryo cell line is useful for making a germ line chimeric fish,
CC particularly zebrafish, which is a valuable model for genetic studies of
CC human diseases. The present sequence represents a PCR primer for
CC zebrafish EGFP, which is used in an example from the present invention

PT   New antisense compound useful for treating diseases such as
PT   hyperproliferative or inflammatory disorders, hybridizes and inhibits
PT   nucleic acid encoding phosphatidylinositol-4-phosphate 5-kinase, I alpha.
XX
PS   Example 15; Page 83; 117pp; English.
XX
CC   This invention relates to the novel antisense compounds, particularly
CC   antisense oligonucleotides, for the modulation of phosphatidylinositol-4-
CC   phosphate 5-kinase Ialpha (PIP5KIa) expression. The oligonucleotides of
CC   the invention may have antiinflammatory, antitumour or cytostatic
CC   activities through use in a gene therapy method. As a result the
CC   antisense oligonucleotides may be of use for the treatment of an animal
CC   having a disease associated with PIP5KIa such as a hyperproliferative or
CC   inflammatory disorder through inhibition of PIP5KIa expression. The
CC   oligonucleotides of the invention may also be used prophylactically to
CC   prevent or delay infection, inflammation or tumour formation. They may
CC   also be useful for diagnostics, therapeutics, prevention, as research
CC   reagents and kits or for distinguishing functions of various members of a
CC   biological pathway. The present sequence is that of an antisense
CC   oligonucleotide of the invention. The oligonucleotide is a chimeric
CC   phosphorothioate oligonucleotide which has five nucleotide 2'-
CC   methoxyethyl (2'-MOE) wings with a ten nucleotide deoxynucleotide gap.
CC   The oligonucleotide backbone is phosphorothioate throughout

PT   Amplifying expressed genetic sequences from genomic DNA of mammalian or
PT   higher order plant species for printing on DNA microarrays, involves
PT   using the 3' untranslated region of the gene sequence.
XX
PS   Disclosure; Page 7; 15pp; English.
XX
CC   The invention discloses a method for amplifying expressed genetic
CC   sequences from genomic DNA (gDNA) from mammalian or higher order plant
CC   species. The method involves identifying a 3' untranslated region (UTR)
CC   of a gDNA sequence, designing probe, performing PCR, separating the
CC   product by size differentiation and performing a second PCR to amplify
CC   the predetermined sequence. Also claimed is a biological analysis device,
CC   comprising a substrate and an array of a set of expressed genetic
CC   sequences, located on the substrate, which are generated by the method
CC   above and a DNA high-density microarray comprising a substrate upon which
CC   are deposited an array of biosites of genomic DNA fragments having the
```

CC sequence of at least one exon, and absent polyadenine and vector
CC sequences, where the genomic DNA fragments have a sequence length of from
CC about 75-2000 nucleotides. The method is efficient for amplifying gene
CC sequences, enables large-scale production of gDNA sequences, generates
CC large quantities of gDNA probes, which enables greater efficiency for
CC printing in microarray formats, fabricates high-density DNA arrays of
CC enhanced, widely varying genetic content and abstains from using RNA-
CC derived sequences by simple PCR amplifications without cloning. The
CC method produces amplified sequences that have greater specificity and
CC size consistency than that observed with cDNA fragments, and allows for
CC greater signal sensitivity than oligonucleotides. The sequence presented
CC is a Type II gene specific primer

PT   New FCTRX polypeptide and encoding polynucleotide, useful for preventing
PT   or treating FCTRX-related disorders, such as cancer, autoimmune,
PT   neurodegenerative, gastrointestinal, reproductive and inflammatory
PT   diseases.
XX
PS   Example 2; Page 146; 155pp; English.
XX
CC   The invention relates to FCTRX polypeptides and the polynucleotides
CC   encoding them. The sequences of the invention are useful for the
CC   manufacture of a medicament for diagnosing and treating disorders
CC   associated with the FCTRX polypeptide, such as colorectal cancer,
CC   adenomatous polyposis coli, myelogenous leukaemia, congenital neonatal
CC   autoimmune thrombocytopenia, malignant ovarian tumours, malignant brain
CC   tumours, mammary tumours, human gliomas, astrocytomas, renal cell
CC   carcinoma, breast adenocarcinoma, ovarian carcinoma, melanomas, clear
CC   cell and granular cell carcinomas, neurological disorders,
CC   neurodegenerative disorders, nerve trauma, familial myelodysplastic
CC   syndrome, Charcot-Marie-Tooth neuropathy, Gardner syndrome, mental health
CC   conditions, immunological disorders, allergy and infection, asthma, lung
CC   diseases, male and female reproductive disorders, deafness, glycoprotein
CC   deficiency, desmoid tumour, turcot syndrome, liver cirrhosis, hepatitis
CC   C, gastric disorders, pancreatic diseases, diabetes, schistosoma mansoni
CC   infection, spinocerebellar ataxia, plasmodium falciparum infection,
CC   Groenouw's corneal dystrophy and lattice corneal dystrophy. This sequence
CC   represents a PCR primer used to amplify cDNA encoding an FCTRX
CC   polypeptide of the invention.

PT   Diagnosing or determining cancer or increased risk of cancer in a
PT   patient, by testing Fanconi Anemia/BRCA pathway gene or protein for a
PT   cancer-associated defect, that indicates cancer or increased risk of
PT   cancer.
XX
PS   Claim 11; SEQ ID NO 145; 160pp; English.
XX
CC   The invention relates to a novel method of diagnosing or determining if a
CC   patient has cancer or is at increased risk of cancer, involving testing a
CC   Fanconi Anaemia (FA)/BRCA pathway gene or protein for the presence of a
CC   cancer-associated defect, where the presence of one or more cancer-
CC   associated defects is indicative of cancer or an increased risk of cancer
CC   in the patient. The method of the invention has cytostatic activity. The
CC   method is useful for determining if a patient has cancer, or is at
CC   increased risk of developing cancer, e.g. breast, ovarian or prostate
CC   cancer. A microarray of the invention is useful for determining if a
CC   patient has cancer, or is at increased risk of developing cancer, by
```

CC hybridising a nucleic acid sample to the nucleic acid sequences from the
CC array, and detecting the presence of mutations in FA/BRCA pathway genes
CC in the nucleic acid sample from the patient, where detecting the presence
CC of mutations is indicative of a patient who has cancer, or is at
CC increased risk of developing cancer. A method of the invention is useful
CC for screening a chemosensitising agent, and the agent obtained is useful
CC for treating a patient having a cancer. The present sequence is used in
CC the exemplification of the invention.

PT Novel isolated nucleic acid molecule comprising single nucleotide
PT polymorphism associated with fish, useful for forming PCR primers which
PT are used for detecting single nucleotide polymorphisms in fish nucleic
PT acids.
XX
PS Claim 18; SEQ ID NO 663; 233pp; English.
XX
CC The present invention describes an isolated nucleic acid (I) comprising a
CC single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid of
CC Salmo salar SNPs, Oreochromis niloticus SNPs or Atlantic halibut SNPs;
CC and (ii) a nucleic acid having nucleotide sequence that hybridises to
CC (i), or its complement under highly stringent hybridisation conditions.
CC Also described: (1) an isolated oligonucleotide (II) comprising at least
CC 17 contiguous nucleotides of a nucleotide sequence of S. salar SNPs, O.
CC niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod
CC polymorphic sites and seabass polymorphic sites, or their complement; (2)
CC a primer pair (III) suitable for use in PCR, comprising two (II) capable
CC of amplifying a nucleotide sequence chosen from S. salar SNPs and, O.
CC niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod
CC polymorphic sites and seabass polymorphic sites; and determining (M1) the
CC origin of fish sample comprising providing a parentage genotype database
CC comprising a collection of candidate parent genotypes, where each of the
CC candidate parent genotype represents a distinct origin, and comparing a
CC sample genotype to the parentage genotype database, where a match between
CC the sample genotype and one of the candidate parent genotype identifies
CC to the origin of the sample. (M1) is useful for determining the origin of
CC a fish sample such as family salmonidae, S. salar, Tilapia, O. niloticus,
CC rainbow trout, halibut, seabass and Atlantic cod. (II) is useful for
CC detecting nucleic acid molecule comprising SNP in a sample, which
CC involves contacting the sample containing nucleic acids with one or more
CC (II) derived from nucleotide sequence of S. salar SNPs and O. niloticus
CC SNPs, and identifying nucleic acid that hybridises to (II). (II) is
CC useful for detecting nucleic acid molecule comprising a polymorphic
CC sequence in a sample, comprising contacting the sample containing nucleic
CC acids with one or more (II) which is derived from O. niloticus
CC microsatellite, O. niloticus SNPs, Atlantic halibut SNPs, cod polymorphic
CC sites or seabass polymorphic sites, and identifying a nucleic acid that
CC hybridises to (II). (III) is useful for detecting nucleic acid molecule
CC comprising a microsatellite sequence in sample. The present sequence is
CC used in the exemplification of the present invention.

XX
PS   Disclosure; Page 65; 0pp; English.
XX
CC   The invention relates to an isolated polypeptide termed human T139 (TANGO
CC   -139), T125, T110, murine T175, human T175 or murine WDNM-2. T139 is
CC   useful for treating kidney defects such as kidney failure or hyperplasia,
CC   T125 is useful for treating wound healing and cancer, T110 is useful for
CC   treating neoplasia, inappropriate angiogenesis or tissue regeneration and
CC   T177 or WDNM-2 is useful for treating cancer, inflammatory disorders and
CC   haematopoietic disorders. T125 and 110 are useful to treat pancreatic
CC   disorders such as pancreatitis, diabetes mellitus, and Zollinger-Ellison
CC   syndrome, placental disorders such as placentitis or abortion and
CC   disorders of the brain such as cerebral edema, cerebrovascular disease
CC   and tumours and injury or trauma to the brain. T125, 110, 175 molecules
CC   treat heart disorders e.g., ischaemic heart disease, atherosclerosis,
CC   hypertension, angina pectoris, pulmonary (lung) disorders such as
CC   rheumatoid lung disease, bronchial asthma and Goodpasture's syndrome,
CC   disorders of skeletal muscle such as muscular dystrophy, motor neuron
CC   disease e.g., amyotrophic lateral sclerosis, cardiovascular disorders
CC   such as rheumatic heart disease or myocardial disease, hepatic disorder
CC   including jaundice, hepatic failure, Crigler-Naijar syndromes or
CC   malignant tumours. T139, 125, 110 and 175 molecules are useful to treat
CC   renal (kidney) disorders such as glomerular disease (e.g., acute and
CC   chronic glomerulonephritis) and reproductive disorders including
CC   ovulation disorder, disorders due to infections and ovarian disorders.
CC   T139, 125 and 175 are useful to treat testicular disorders and sperm cell
CC   disorders. T175 is useful to treat uterine disorders, hyperplasia of the
CC   endometrium, uterine cancer, bone marrow, blood and haematopoietic
CC   associated diseases and disorders, e.g., acute myeloid leukaemia,
CC   haemophilia, anaemia and thalassaemia. T-110 is useful to treat spleen
CC   e.g., the foetal spleen associated diseases and disorder e.g., splenic
CC   lymphoma and/or splenomegaly. T125 treats prostate disorders such as
CC   inflammatory diseases, ovarian disorders such as ovarian endometriosis,
CC   non-neoplastic cysts and tumours, intestinal disorders such as infective
CC   enterocolitis, Crohn's disease and Whipple's disease, colonic disorders
CC   such as congenital anomalies and tumours. T139, 125, 110, 175 or WDNM-2
CC   are useful for treating proliferative disorders, inflammatory disorders
CC   e.g., bacterial infection, psoriasis, e.g., ulcerative colitis, arthritis
CC   and allergic inflammatory disorders (e.g., asthma, psoriasis). The
CC   invention is useful in gene therapy. The present sequence is human TANGO
CC   cDNA related PCR primer

CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO

CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

PT New nucleic acid molecule comprising a sequence of an allele of a
PT polymorphic bovine acyl CoA-diacylglycerol transferase gene useful for
PT testing a mammal for its predisposition for fat content of milk and for
PT meat marbling.
XX
PS Example 1; Page 36; 91pp; English.
XX
CC The present invention describes a nucleic acid molecule (NA) (I) encoding
CC a bovine acyl CoA-diacylglycerol transferase (DGAT) contributing to or
CC indicative for low fat content of milk and to low meat marbling
CC (intramuscular fat content). Human DGAT is located to chromosome 8, and
CC bovine DGAT is located to chromosome 14. (I) is useful for testing a
CC mammal for its predisposition for fat content of milk and/or its
CC predisposition for meat marbling. The method comprises analysing the gene
CC encoding DGAT for nucleotide polymorphisms (e.g. single nucleotide
CC polymorphisms (SNPs)) which are connected with the predisposition. The
CC nucleotide polymorphisms are located in the coding region of the DGAT
CC gene and result in substitution, deletion and/or addition of an amino
CC acid sequence of the polypeptide which is encoded by the gene. The
CC nucleic acid molecule has at the position 10433 and 10434 of the DGAT
CC gene a guanine and a cytosine residue, at position 3343 a cytosine or
CC guanine, 11030 a guanine, 11048 a cytosine or thymine and 11093 a
CC thymine, which correlate with a predisposition for low fat content of
CC milk and low meat marbling. The nucleic acid molecule has at the position
CC corresponding to position 10433 and 10434 of the DGAT gene two adenine
CC residues which correlate with a predisposition for high content of milk
CC and high meat marbling. The nucleotide polymorphisms are located in a
CC region which is responsible for the regulation of the expression of the
CC product of the gene encoding DGAT. ABZ76924 to ABZ77045 and ABP96035 to
CC ABP96046 represent sequences used in the exemplification of the present
CC invention

PT Pharmaceutical composition for treating asthma, has antisense
PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and
PT bronchodilating agent.
XX
PS Claim 15; SEQ ID NO 1588; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

PS Claim 15; SEQ ID NO 2168; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,

```
CC   analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC   beta-adrenergic agonist. The composition is useful for preventing or
CC   treating a respiratory, lung or malignant disease. The administered
CC   composition comprises oligo and is administered to reduce the production
CC   or availability, or to increase the degradation of the target mRNA or to
CC   reduce the amount of target polypeptide present in the lungs. The
CC   pulmonary obstruction, and/or bronchoconstriction and/or lung
CC   inflammation, allergies and/or surfactant hypoproduction are associated
CC   with a disease or condition such as pulmonary vasoconstriction,
CC   inflammation, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC   transplantation rejection, pulmonary infections, bronchitis or cancer.
CC   The reduced adenosine content of the anti-sense oligos corresponding to
CC   thymidines present in the target RNA serves to prevent the breakdown of
CC   the oligonucleotides into products that free adenosine into the system
CC   e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC   prevent any unwanted effects due to it

PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and
PT bronchodilating agent.
XX
PS Claim 15; SEQ ID NO 8773; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,

```
CC   comprising oligonucleotides, effective for alleviating
CC   bronchoconstriction, respiratory tract inflammation, allergies and
CC   reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC   surfactant depletion or hyposecretion, when administered to a mammal. The
CC   oligonucleotides are derived from a gene encoding or regulating
CC   expression of a target polypeptide associated with lung airway or lung
CC   dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC   The invention also describes a kit, that comprises: (a) a delivery
CC   device, in separate containers, (b) the oligonucleotides, (c)
CC   instructions for adding a carrier and for use of the kit. The composition
CC   of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC   analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC   beta-adrenergic agonist. The composition is useful for preventing or
CC   treating a respiratory, lung or malignant disease. The administered
CC   composition comprises oligo and is administered to reduce the production
CC   or availability, or to increase the degradation of the target mRNA or to
CC   reduce the amount of target polypeptide present in the lungs. The
CC   pulmonary obstruction, and/or bronchoconstriction and/or lung
CC   inflammation, allergies and/or surfactant hypoproduction are associated
CC   with a disease or condition such as pulmonary vasoconstriction,
CC   inflammation, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC   transplantation rejection, pulmonary infections, bronchitis or cancer.
CC   The reduced adenosine content of the anti-sense oligos corresponding to
CC   thymidines present in the target RNA serves to prevent the breakdown of
CC   the oligonucleotides into products that free adenosine into the system
CC   e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC   prevent any unwanted effects due to it

PT   New pharmaceutical compositions comprising oligonucleotide in combination
PT   with e.g. arboplatin or cisplatin, useful for inhibiting protein kinase C
PT   expression, particularly for treating cancer, e.g. non-Hodgkin's
PT   lymphoma.
XX
PS   Example 15; SEQ ID NO 65; 52pp; English.
XX
CC   The invention describes new pharmaceutical compositions comprising an
CC   oligonucleotide up to 50 nucleotide units in length of a sequence having
CC   20 bp (dna1), in combination with any of the following: carboplatin and
CC   paclitaxel; docetaxel; cisplatin and gemcitabine; or 5-fluorouracil and
CC   leucovorin. Also described are: a method of inhibiting protein kinase C
CC   (PKC)-alpha expression in human cells by contacting the cells with any of
CC   the pharmaceutical compositions; and methods of treating a condition
CC   associated with expression of human PKC-alpha by administering to an
CC   animal, or its cells, tissues or bodily fluid any of the pharmaceutical
CC   compositions. The compositions are useful for inhibiting PKC-alpha
CC   expression in human cells. The compositions are useful for treating a
CC   condition associated with the expression of human PKC-alpha, particularly
CC   cancer. In particular, the compositions are useful for treating non-small
CC   cell lung cancer or non-Hodgkin's lymphoma in a human. This sequence
CC   represents a human protein kinase C antisense oligonucleotide.

PT   New compounds, particularly antisense oligonucleotides targeted to a
PT   nucleic acid encoding TGF-beta 2, useful for treating cancer, a
PT   neurodegenerative disorder, or a disease involving hyperactivation of
PT   immune response.
XX
PS   Example 16; SEQ ID NO 101; 135pp; English.
XX
CC   The invention relates to a novel antisense compound of 8-80 nucleobases
CC   in length targeted to, and which specifically hybridizes with, a nucleic
CC   acid molecule encoding transforming growth factor (TGF)-beta 2, and
CC   inhibits the expression of TGF-beta 2. The invention further relates to:
CC   a compound 8-80 nucleobases in length that specifically hybridizes with
CC   at least an 8-nucleobase portion of an active site on a nucleic acid
CC   molecule encoding TGF-beta 2; a composition comprising the compound and a
CC   carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or
CC   tissues by contacting the cells or tissues with the compound so that
CC   expression of TGF-beta 2 is inhibited; treating an animal having a
CC   disease or condition associated with TGF-beta 2 by administering to the
CC   animal a therapeutic or prophylactic amount of the compound so that
CC   expression of TGF-beta 2 is inhibited; and screening an antisense
CC   compound. The antisense compound has cytostatic, nootropic,
CC   neuroprotective, and immunosuppressive activities. The compound,
CC   composition and methods are useful for treating a disease or condition
CC   associated with TGF-beta 2, such as a hyperproliferative disorder e.g.
CC   cancer, a neurodegenerative disorder, or a disease or condition involving
CC   hyperactivation of an immune response. This polynucleotide sequence
CC   represents an antisense oligonucleotide of the invention.

PT   New isolated nucleic acid coding for a dominant negative, mutant RAB7
PT   polypeptide and/or a dominant negative, mutant ARHGEF10 polypeptide,
PT   useful for detecting the presence of peripheral neuropathy in a human.
XX
PS   Example; Page 23; 38pp; English.
XX
CC   The present invention describes an isolated nucleic acid (I) coding for a
CC   dominant negative, mutant RAB7 polypeptide and/or a dominant negative,
CC   mutant ARHGEF10 polypeptide. (I) contains in comparison to the wild type
CC   RAB7 encoding sequence comprising 624 bp (SEQ ID NO: 1, ADI25025) and/or
CC   to the wild type ARHGEF10 encoding sequence comprising 3366 bp (SEQ ID
CC   NO: 3, ADI25027), one or more mutations, where the presence of the
CC   nucleic acids is indicative for a predisposition or presence of a
CC   peripheral neuropathy. Also described: (1) a nucleic acid probe which is
CC   a fragment of (I); (2) a recombinant vector comprising (I); (3) a host
CC   cell comprising a recombinant vector of (2); (4) a method for the
CC   preparation of a diagnostic assay to detect the presence of a peripheral
CC   neuropathy in a human; and (5) a transgenic non-human animal comprising
CC   the vector of (2). (I) is useful for isolating and detecting human
CC   peripheral neuropathy causing or predisposing genes. The diagnostic assay
CC   is useful for detecting the presence of peripheral neuropathy in a human.
CC   The present sequence represents a PCR primer for the mutation analysis of
CC   human ARHGEF10, which is used in the exemplification of the present
```

PT Identifying loss of imprinting of the IGF2 gene to determine increased
PT risk of developing cancer comprises analyzing biological sample from the
PT subject for hypomethylation of a differentially methylated region (DMR)
PT of the H19 or IGF2 gene.
XX
PS Claim 9; SEQ ID NO 28; 122pp; English.
XX
CC The present invention describes a method for identifying loss of
CC imprinting of the IGF2 gene in a subject. The method comprises analysing
CC a biological sample from the subject for hypomethylation of a
CC differentially methylated region (DMR) of at least one of the H19 gene
CC and the IGF2 gene. Also described: (1) identifying an increased risk of
CC developing cancer in a human subject; and (2) a kit for determining a
CC methylation status of a differentially methylated region (DMR) of IGF2 or
CC H19 comprising the primer pair. The method is useful for identifying loss
CC of imprinting of the IGF2 gene to determine an increased risk of
CC developing cancer in a subject. The present sequence represents a PCR
CC primer for the DMR of the human IGF2 gene, which is used in the
CC exemplification of the present invention.

PT Novel single or multiple target oligonucleotide anti-sense to e.g.
PT initiation codons and introns of respiratory disease-relevant genes e.g.,
PT CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory
PT disease e.g., asthma.
XX
PS Claim 2; SEQ ID NO 2048; 85pp; English.
XX
CC The present invention relates to an oligonucleotide anti-sense to e.g.,
CC initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-
CC end of nucleic acid target comprising gene(s) chosen from e.g.
CC interleukin (IL)-4 receptor, IL-5 receptor or salts of the
CC oligonucleotide and optionally surfactant operatively linked to the
CC oligonucleotide. The method is useful for preventing or treating a
CC respiratory or lung disease, which involves administering to the airways
CC of a subject an effective amount of an inhibitor. The oligonucleotide is
CC useful for production of a medicament for the prevention and/or treatment
CC of a respiratory or lung disease. The respiratory or lung disease is
CC chosen from airway inflammation, allergy(ies), asthma, impeded
CC respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases
CC (COPD), allergic rhinitis (AR), acute respiratory distress syndrome
CC (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway
CC obstruction. The present sequence represents an oligonucleotide of the
CC invention.

PT   New antisense oligonucleotides targeted to a nucleic acid encoding liver
PT   related homologue-1 (LRH1), useful for treating breast cancer,
PT   dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
XX
PS   Example 15; SEQ ID NO 1506; 909pp; English.
XX
CC   This invention relates to novel antisense compounds useful for modulating
CC   the expression of liver related homologue-1 (LRH1) and splice variants
CC   thereof. Specifically, it refers to compositions 8-30 nucleobases in
CC   length that target a portion of an active site on the nucleic acid
CC   molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan
CC   nuclear receptor protein that functions as a tissue specific
CC   transcription factor. The present invention describes antisense
CC   oligonucleotides that comprise at least one modified internucleoside
CC   linkage, a phosphorothioate linkage; at least one modified sugar moiety,
CC   a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-
CC   methylcytidine. These antisense compounds are useful for treating or
CC   diagnosing a disease associated with LRH1, such as breast cancer,
CC   dyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), high
CC   LDL (low density lipoprotein), hypercholesterolaemia, gall stones,
CC   triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic
CC   hepatitis, as well as hepatocellular carcinoma or a condition associated
CC   with aromatase activity. Accordingly, these compositions exhibit
CC   cytostatic, antilipaemic, antiarteriosclerotic, anorectic, hepatotropic,
CC   litholytic, antiinflammatory and virucidal activities. This
CC   oligonucleotide sequence is an antisense DNA oligo used to modulate the
CC   expression of the human LRH1 protein of the invention.

PT   New antisense oligonucleotide for modulating endothelial lipase
PT   expression, for diagnosing, preventing or treating e.g. dyslipidemia, low
```

PT high density lipoprotein or cardiovascular disorders.
XX
PS Claim 3; SEQ ID NO 1520; 1007pp; English.
XX
CC The present invention relates to antisense oligonucleotides (ADJ21603-
CC ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence
CC (ADJ25517), where the antisense oligonucleotide specifically hybridises
CC with and inhibits the expression of EL. The antisense oligonucleotides
CC are useful for modulating the expression of endothelial lipase in cells
CC or tissues to treat diseases associated with EL expression, such as
CC dyslipidaemia, low high density lipoprotein (HDL), cardiovascular
CC disorder or metabolic syndrome X. In addition, the oligonucleotides are
CC used for diagnostics, prophylaxis, or as research reagents or kits.

PT   New antisense compound targeted to a nucleic acid molecule encoding
PT   Nav1.3, useful for useful for treating a disease or condition associated
PT   with Nav1.3, e.g. pain, seizure disorder such as childhood seizure
PT   disorder, or ataxia.
XX
PS   Claim 4; SEQ ID NO 3586; 417pp; English.
XX
CC   The present invention relates to an antisense compound targeted to a
CC   nucleic acid molecule encoding Nav1.3, where the antisense compound
CC   specifically hybridizes with and inhibits the expression of Nav1.3. The
CC   compound and composition are useful for treating a disease or condition
CC   associated with Nav1.3, e.g. pain including but not limited to
CC   neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain,
CC   diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain,
CC   pain from burns, migraine headache, cluster headache, mild-to-moderate
CC   headache; seizure disorder such as childhood seizure disorder, including
CC   but not limited to neonatal or infantile epilepsy; or ataxia. The present
CC   sequence represents a chimeric phosphorothioate oligonucleotide with
CC   2'MOE wings and a deoxy gap. Used during the antisense inhibition of
CC   human Nav1.3 expression, the oligonucleotides are designed to target
CC   different regions of the human Nav1.3 RNA.

XX
CC   The invention relates to an antisense compound targeted to a nucleic acid
CC   molecule encoding human vascular endothelial growth factor (VEGF) co-
CC   regulated chemokine-1 (VCC-1), and which specifically hybridises with and
CC   inhibits the expression of VCC-1. The invention also relates to a
CC   composition comprising the antisense compound, a method of inhibiting the
CC   expression of VCC-1 in cells or tissues comprising contacting the cells
CC   or tissues with the antisense compound and a method of treating a human
CC   having a disease or condition associated with VCC-1 comprising
CC   administering the antisense compound to an animal to inhibit expression
CC   of VCC-1. The antisense oligonucleotide comprises at least one modified
CC   internucleoside linkage, preferably a phosphorothioate linkage. It also
CC   comprises at least one modified sugar moiety, preferably a 2'-O-
CC   methoxyethyl sugar moiety, and at least one modified nucleobase,
CC   specifically a 5-methylcytosine. The antisense oligonucleotide preferably
CC   is a chimeric oligonucleotide. The antisense compound is useful for
CC   treating a disease or condition associated with VCC-1, such as diabetes,
CC   an immunological disorder, a cardiovascular disorder, a neurological
CC   disorder, ischaemia, reperfusion injury, cancer or an angiogenic
CC   disorder, e.g. haemangioma, tumour angiogenesis, rheumatoid arthritis,
CC   atherosclerosis, psoriasis or fibrosis after myocardial infarction. VCC-1
CC   antisense oligonucleotides may also be used for wound healing, for
CC   healing of bone fractures and cartilage damage, for regeneration of
CC   tissues or organs, for treating periodontal diseases, for gut protection
CC   or regeneration, for treatment of lung or liver fibrosis or for
CC   management of atrial fibrillation. This sequence represents an antisense
CC   oligonucleotide targeted to DNA encoding the human VCC-1 polypeptide of
CC   the invention.

PT   New antisense oligonucleotides for modulating geranylgeranyl diphosphate
PT   synthase 1 expression, useful for diagnosing, preventing or treating
PT   conditions associated with the protein, e.g. cancer.
XX
PS   Example 15; SEQ ID NO 47; 76pp; English.
XX
CC   This invention relates to a novel antisense compounds that modulate the
CC   expression of human geranylgeranyl diphosphate synthase 1 (also known as
CC   GGPS1, geranylgeranyl pyrophosphate synthetase, GGPPS, ggppsase and
CC   geranyltranstransferase) and located on chromosome 1p43. Specifically, it
CC   refers to compositions useful for inhibiting the expression of GGPS1,
CC   which normally participates in embryonic development, cell
CC   differentiation and stimulates apoptosis via caspase-3 activation. The
CC   present invention describes antisense oligonucleotides that comprise at
CC   least one modified sugar moiety, a 2'-O-methoxyethyl (2' MOE) and at
CC   least one modified nucleobase, a 5-methylcytosine. Accordingly, these
CC   compounds are useful for treating a disease or condition associated with
CC   GGPS1 such as a developmental or hyperproliferative disorder (e.g.
CC   cancer) that arise as a result of aberrant apoptosis. As such, these
CC   compositions exhibit cytostatic activity and are useful for diagnostics,
CC   prophylaxis, research reagents and various kits. This oligonucleotide
CC   sequence is a phosphorothioate antisense DNA oligo used to modulate human
CC   geranylgeranyl diphosphate synthase 1 expression in an exemplification of
CC   the invention.

PT   New antisense compound, having a sequence targeted to a nucleic acid
PT   encoding mPGES-1, useful for preparing a composition for treating e.g.,
PT   inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
PT   ischemia.
XX
PS   Claim 4; SEQ ID NO 1294; 132pp; English.
XX
CC   The present sequence represents a chimeric antisense oligonucleotide
CC   targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The
CC   human mPGES-1 gene is located on chromosome 9, more specifically to
CC   9q34.3. The present invention also describes: (1) antisense compounds,
CC   having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
CC   mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
CC   inhibits its expression; (2) a method of inhibiting the expression of
CC   mPGES-1 in cells or tissues; and (3) a method of treating an animal
CC   having a disease or condition associated with mPGES-1. MPGES-1 chimeric
CC   antisense oligonucleotides and antisense compounds have cytostatic,
CC   antidiabetic, immunomodulator, cardiant, neuroprotective,
CC   antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,
CC   ophthalmological, immunomodulatory and cardiovascular activities, and can
CC   be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
CC   can be used for preparing a composition for treating a disease or
CC   condition associated with mPGES-1 e.g., inflammation, Alzheimer's
CC   disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
CC   ophthalmic, immunological, cardiovascular or neurological disorder.

CC   The present sequence represents a chimeric antisense oligonucleotide
```

```
CC   targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The
CC   human mPGES-1 gene is located on chromosome 9, more specifically to
CC   9q34.3. The present invention also describes: (1) antisense compounds,
CC   having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
CC   mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
CC   inhibits its expression; (2) a method of inhibiting the expression of
CC   mPGES-1 in cells or tissues; and (3) a method of treating an animal
CC   having a disease or condition associated with mPGES-1. MPGES-1 chimeric
CC   antisense oligonucleotides and antisense compounds have cytostatic,
CC   antidiabetic, immunomodulator, cardiant, neuroprotective,
CC   antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,
CC   ophthalmological, immunomodulatory and cardiovascular activities, and can
CC   be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
CC   can be used for preparing a composition for treating a disease or
CC   condition associated with mPGES-1 e.g., inflammation, Alzheimer's
CC   disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
CC   ophthalmic, immunological, cardiovascular or neurological disorder.

XX
CC The invention relates to oligonucleotides anti-sense to an initiation
CC codon, coding region, 5' or 3' intron-exon junction, intron or region
CC with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target
CC chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)
CC -5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM,
CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention
CC also relates to a method of screening a candidate compound that binds to
CC one or more nucleic acid target(s) or expressed product(s), for the
CC prevention and/or treatment of a respiratory or lung disease. The
CC oligonucleotides are useful for reducing or inhibiting expression of a
CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor,
CC CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a,
CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are
CC useful for preventing or treating a respiratory or lung disease. The
CC respiratory or lung disease is associated with hyper-responsiveness to
CC and/or increased levels of, adenosine and/or levels of adenosine A
CC receptor(s), and/or asthma and/or lung allergies associated with
CC inflammation or an inflammatory disease. The respiratory or lung disease
CC is chosen from airway inflammation, allergy, asthma, impeded respiration,
CC cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD),
CC allergic rhinitis, acute respiratory distress syndrome, pulmonary
CC hypertension, lung inflammation, bronchitis, airway obstruction or
CC bronchoconstriction. This sequence represents an oligonucleotide of the
CC invention.

PT   New isolated polynucleotides for sensing carbohydrates, other sweeteners,
PT   or ethanol, useful for screening drugs for inhibition or restoration of
PT   gene function as antidiabetic, antiobesity or antialcohol consumption
PT   therapies.
XX
PS   Example 12; SEQ ID NO 393; 148pp; English.
XX
CC   The invention relates to SAC1 polypeptides and the polynucleotides
CC   encoding them. The polynucleotides contain a variation associated with
CC   sensing carbohydrates, other sweeteners or ethanol. The invention also
CC   relates to a method for analysing a biomolecule in a biological sample,
CC   comprising altering SAC1 activity in the sample and measuring the
CC   activity, a method for analysing a polynucleotide in a biological sample,
CC   comprising contacting a polynucleotide in a biological sample with a
CC   probe where the probe hybridises to a SAC1 polynucleotide to form a
CC   hybridisation complex and detecting the hybridisation complex, a method
CC   of identifying susceptibility to obesity or diabetes comprising comparing
CC   the nucleotide sequence of the suspected SAC1 allele with a wild type
CC   nucleotide sequence, where the difference between the suspected allele
CC   and the wild-type sequence identifies a sequence variation of the SAC1
CC   nucleotide sequence, and a method of treating or preventing obesity,
CC   diabetes or alcoholism associated with expression of SAC1, comprising
CC   administering to a subject a pharmaceutical composition and a transgenic
CC   animal that carries an altered SAC1 allele. The methods and compositions
CC   of the invention are useful for screening drugs for inhibition or
CC   restoration of gene function as antidiabetic, antiobesity or antialcohol
CC   consumption therapies and for identifying sweeteners and alcohols. This
CC   sequence represents a PCR primer used to amplify murine SAC1 DNA of the
CC   invention.

PT   Use of leukotriene synthesis inhibitor for manufacture of a medicament
PT   for treatment for myocardial infarction or susceptibility to myocardial
PT   infarction in individual.
XX
PS   Disclosure; SEQ ID NO 318; 306pp; English.
XX
CC   The present invention describes using a leukotriene synthesis inhibitor
CC   (I) for the manufacture of a medicament for the treatment of myocardial
CC   infarction or susceptibility to myocardial infarction in an individual.
CC   Also described is a method (M1) for the treatment of acute coronary
CC   syndrome (ACS) in an individual comprising administering (I). (I) has
CC   antiatherosclerotic, cardiant and antianginal activities, and can be used
CC   as a leukotriene biosynthesis inhibitor, and a leukotriene receptor
CC   antagonist. (I) can be use for the manufacture of a medicament for the
CC   treatment of myocardial infarction or susceptibility to myocardial
CC   infarction in an individual who has at least one risk factor chosen from
CC   an at-risk haplotype for myocardial infarction, an at-risk haplotype in
CC   the 5-lipoxygenase activating protein (FLAP) gene, a polymorphism in a
CC   FLAP nucleic acid and an at-risk polymorphism in the 5-lipoxygenase (5-
CC   LO) gene promoter; in an individual who has at least one risk factor
CC   chosen from diabetes, hypertension, hypercholesterolaemia, elevated
CC   1p(a), obesity, past or current smoker; in an individual having elevated
CC   inflammatory marker chosen from C-reactive protein (CRP), serum amyloid
CC   A, fibrinogen, leukotriene, leukotriene metabolite, interleukin-6, tissue
CC   necrosis factor-alpha, soluble vascular cell adhesion molecule (sVCAM),.
```

```
CC   soluble intervascular adhesion molecule (sICAM), E-selectin, matrix
CC   metalloprotease type-1, matrix metalloprotease type-2, matrix
CC   metalloprotease type-3 and matrix metalloprotease type-9; in an
CC   individual having increased low density lipoprotein (LDL) cholesterol
CC   and/or decreased high density lipoprotein (HDL) cholesterol; in an
CC   individual having increased leukotriene synthesis; in an individual
CC   having previous myocardial infarction or acute coronary syndrome (ACS)
CC   event, stable angina; or in an individual who has atherosclerosis or who
CC   requires treatment to restore blood flow in arteries. (M1) is useful for
CC   treating an individual suffering from acute coronary syndrome chosen from
CC   unstable angina, non-ST-elevation myocardial infarction (NSTEMI) and ST-
CC   elevation myocardial infarction (STEMI). The human FLAP gene is located
CC   on chromosome 13, more specifically to 13q12. The present sequence
CC   represents a microsatellite marker used in the exemplification of the
CC   present invention.

PT   New antisense oligonucleotides useful for modulating expression of
PT   Farnesoid X Receptor (FXR) or for treating diseases associated with FXR,
PT   e.g. diabetes, immunological disorders, cardiovascular disorders,
PT   gallstones or obesity.
XX
PS   Claim 4; SEQ ID NO 1309; 150pp; English.
XX
CC   The invention relates to an antisense compound 8-30 nucleobases in length
CC   targeted to a nucleic acid molecule encoding Farnesoid X receptor (FXR),
CC   where the antisense compound specifically hybridizes with and inhibits
CC   the expression of FXR. The composition and methods are useful for
CC   inhibiting the expression of FXR (Farnesoid X receptor) in cells or
CC   tissues, or for treating diseases or conditions associated with FXR, such
CC   as diabetes, immunological disorders, cardiovascular disorders, e.g.
CC   dyslipidemia and its symptoms, atherosclerosis, low HDL (high density
CC   lipoprotein), elevated LDL (low density lipoprotein) or
CC   hypercholesterolemia, gallstones, hypertriglyceridemia, obesity,
CC   neurological disorders, or ischemia/reperfusion injury. In addition, the
CC   composition is used for diagnostics, prophylaxis, or as research reagents
CC   or kits. This sequence corresponds to an antisense oligonucleotide of the
CC   invention.

XX
CC   The present invention relates to a compound which specifically hybridizes
CC   with a nucleic acid molecule encoding GFAT, and inhibits the expression
CC   of GFAT. Specifically claimed are antisense oligonucleotides capable of
CC   modulating the expression of GFAT, and which comprise any of the 3063
CC   sequences of 20 base pairs, given in the specification. The compound,
CC   composition and methods are useful for treating a disease or condition
CC   associated with GFAT, such as a disease or condition, e.g. diabetes, a
CC   cardiovascular or neurological disorder, ischemia/reperfusion injury.
CC   They are also useful in research and diagnostics for modulating the
CC   expression of GFAT. The present sequence represents a chimeric
CC   phosphorothioate oligonucleotide with 2'-MOE wings and a deoxy gap, these
CC   oligonucleotides inhibit human GFAT expression.

PS   Claim 58; SEQ ID NO 963; 1762pp; English.
XX
CC   The present invention relates to diagnosing or monitoring transplant
CC   rejection, e.g. cardiac or kidney transplant rejection, in an individual
CC   comprises detecting the expression level of one or more genes. The
CC   methods, system and kits are useful in diagnosing or monitoring
CC   transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic
CC   islet, lung, bone marrow or stem cell transplant rejection,
CC   xenotransplant rejection or mechanical organ replacement rejection, in an
CC   individual. The method is also useful in assessing the immune status of
CC   an individual. The methods are also useful in diagnosing and monitoring
CC   diseases that involve the immune system, e.g. rheumatoid arthritis,
CC   lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or
CC   viral, bacterial or fungal infection. The present sequence represents a
CC   primer for a 50 mer oligonucleotide marker for diagnosis and monitoring
CC   of allograft rejection and other disorders.

PT   rejection, in an individual, comprises detecting the expression level of
PT   the genes.
XX
PS   Claim 58; SEQ ID NO 1861; 1762pp; English.
XX
CC   The present invention relates to diagnosing or monitoring transplant
CC   rejection, e.g. cardiac or kidney transplant rejection, in an individual
CC   comprises detecting the expression level of one or more genes. The
CC   methods, system and kits are useful in diagnosing or monitoring
CC   transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic
CC   islet, lung, bone marrow or stem cell transplant rejection,
CC   xenotransplant rejection or mechanical organ replacement rejection, in an
CC   individual. The method is also useful in assessing the immune status of
CC   an individual. The methods are also useful in diagnosing and monitoring
CC   diseases that involve the immune system, e.g. rheumatoid arthritis,
CC   lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or
CC   viral, bacterial or fungal infection. The present sequence represents a
CC   primer for a 50 mer oligonucleotide marker for diagnosis and monitoring
CC   of allograft rejection and other disorders.

PT   Predicting a subject's response to an agent capable of binding to a
PT   growth hormone receptor (GHR) protein comprises determining in the
PT   subject the presence or absence of an allele of the GHR gene.
XX
PS   Disclosure; Fig 3A; 116pp; English.
XX
CC   The specification describes a method for predicting a subject's response
CC   to an agent capable of binding to a growth hormone receptor (GHR)
CC   protein. The method comprises determining in the subject the presence or
CC   absence of an allele of the GHR gene, where the allele is correlated with
CC   a likelihood of having an increased or decreased positive response to the
CC   agent, to identify the subject as having an increased or decreased
CC   likelihood of responding to treatment with the agent. The method is
CC   useful in predicting a subject's response to an agent capable of binding
CC   to a GHR protein for treating a subject suffering from obesity, diabetes,
CC   infection, acromegaly or gigantism conditions, as well as conditions
CC   associated with abnormal sodium or water retention, metabolic syndrome,
CC   mood or sleep disorder, cancer, cardiac disease or hypertension. PCR
CC   primers ADQ91497-ADQ91499 were used for a GHR-exon 3 genotyping test, to
CC   identify deletions in exon 3 leading to a mutant GHR.

PT   Integrating a polynucleotide into a fish cell by introducing a modifying
PT   polynucleotide having a first and a second homologous region that will
PT   undergo homologous recombination with a first and second region of the
PT   target polynucleotide.
XX
PS   Example 1; SEQ ID NO 2; 47pp; English.
XX
CC   The present invention relates to a method of integrating a polynucleotide
CC   into a fish cell, comprising introducing a modifying polynucleotide
CC   comprising a first homologous region that will undergo homologous
CC   recombination with a first region of the target polynucleotide, and a
CC   second homologous region that will undergo homologous recombination with
CC   a second region of the target polynucleotide. The method is useful for
CC   integrating a polynucleotide into a fish cell, for making a germline
CC   chimaeric fish, or for making a fish heterozygous or homozygous for a
CC   mutation. The present sequence is a PCR primer used to demonstrate the
CC   method of the invention.

CC This invention describes novel oligonucleotide primers or peptide nucleic
CC acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
CC and cytosine methylation status in chemically pretreated genomic DNA. The
CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a
CC range of diseases including immune system, gastrointestinal, respiratory,
CC central nervous system, cardiovascular and metabolic disorders. The
CC oligomers are also used for detecting cell type differentiation. ABC00010
CC -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073

PT   Novel genetic variants of G-protein coupled receptor gene useful in
PT   studying expression and function of the protein, and for screening drugs
PT   to treat diseases e.g. cancer.
XX
PS   Claim 16; Page 13; 75pp; English.
XX
CC   The invention relates to genetic variants of human G-protein coupled
CC   receptor 31 (GPR31) gene. The invention also relates to compositions and
CC   methods for haplotyping and/or genotyping the GPR31 gene in an
CC   individual. Polynucleotides of the invention are useful in studying the
CC   expression and function of GPR31, and in expressing GPR31 protein for use
CC   in screening candidate drugs to treat diseases related to GPR31 activity
CC   and in studying the effect of the variation on the biological activity of
CC   GPR31 as well as on the binding affinity of candidate drugs targetting
CC   GPR31 for the treatment of cancer. They are also used in gene therapy.
CC   The haplotyping method is useful for improving the efficiency and
CC   reliability of several steps in the discovery and development of drugs
CC   for treating diseases associated with GPR31 activity e.g. cancer. This
CC   method is also useful for haplotyping GPR31 gene in an individual, which
CC   can also be used by the pharmaceutical research scientist to validate
CC   GPR31 as a candidate target for, and in design of clinical trials of
CC   candidate drugs, for treating a specific condition drugs or disease
CC   predicted to be associated with GPR31 activity. The present sequence is
CC   an allele specific oligonucleotide (ASO) primer used to detect human
CC   GPR31 gene polymorphisms

XX
PT   Genetic variants of Glutamate Receptor, Metabotropic 8 isogenes, useful
PT   for improving efficiency and reliability in drug development for treating
PT   neuropathological conditions and retinitis pigmentosa.
XX
PS   Claim 15; Page 14; 110pp; English.
XX
CC   The invention relates to a method for haplotyping the glutamate receptor,
CC   metabotropic 8 (GRM8) gene (ABQ72798, ABQ72905) of an individual, and
CC   also describes 21 novel polymorphic sites within the human GRM8 gene. The
CC   GRM8 gene is located on chromosome 7q31.3-32.1 and contains 10 exons
CC   which encode a 908 amino acid protein (ABB09564). GRM8 is involved in
CC   glutamate-mediated neurotransmission, being a member of a subfamily of
CC   metabotropic glutamate receptors that inhibit the activity of adenylate
CC   cyclase in response to glutamate stimulation. The chromosomal location of
CC   the GRM8 gene encompasses regions linked to Smith-Lemli-Opitz syndrome
CC   and a form of retinitis pigmentosa. GRM8 nucleic acid sequences are
CC   useful in studying the expression and function of GRM8, and in expressing
CC   GRM8 protein for use in screening drugs for the treatment of GRM8-
CC   associated diseases (e.g., neuropathological disorders, Smith-Lemli-Opitz
CC   syndrome and retinitis pigmentosa). GRM8 nucleic acids and proteins are
CC   also useful in studying the effect of polymorphisms on the biological
CC   activity of GRM8. Polymorphisms in the target region may be determined by
CC   the use of allele-specific oligonucleotides (ASOs; ABQ72800-ABQ72862) as
CC   probes and primers, and by primer extension using oligonucleotide primers
CC   comprising sequences ABQ72863-ABQ72904. The method of the invention is
CC   useful for haplotyping the GRM8 gene in populations and in individuals,
CC   enabling decisions to be made as to whether GRM8 is a likely therapeutic
CC   target for a disease of interest, and in the design of clinical trials of
CC   candidate drugs for treating GRM8-associated disorders. In addition,
CC   transgenic animals comprising a human GRM8 gene are useful for studying
CC   the expression of GRM8 isogenes in vivo, for in vivo screening and
CC   testing of drugs targeted to GRM8, and for testing the efficacy of
CC   therapeutic agents and compounds for treating GRM8-associated conditions
CC   in a biological system. Sequences ABQ72821-ABQ72862 represent
CC   specifically claimed allele-specific oligonucleotide (ASO) primers used
CC   for detecting polymorphisms in the GRM8 gene

PT Haplotyping Uncoupling Protein 2 gene of an individual comprises
PT identifying the phased sequence of nucleotides at polymorphic sites of
PT the gene and assigning a haplotype or haplotype pair consistent with the
PT phased sequence.
XX
PS Disclosure; SEQ ID NO 48; 64pp; English.
XX
CC The invention describes haplotyping the uncoupling protein 2
CC (mitochondrial, proton carrier) (UCP2) gene of an individual comprising
CC identifying the phased sequence of nucleotides at polymorphic sites (PS)1
CC -23 for at least one copy of the individual's UCP2 gene and assigning to
CC the individual a UCP2 haplotype or haplotype pair that is consistent with
CC the phased sequence. The composition and methods are useful in
CC haplotyping and/or genotyping the UCP2 gene in an individual to e.g.
CC screen for drugs targeting the UCP2 protein to treat a condition or
CC disease predicted to be associated with UCP2 activity. The disease or
CC condition may include obesity, diabetes, immunological disorders and
CC other diseases associated with defects in body mass and thermoregulation.
CC This sequence represents an allele specific oligonucleotide primer used
CC for detecting human uncoupling protein 2 (UCP2) gene polymorphisms.

XX
CC The present invention provides single-stranded oligonucleotides which can
CC be used for the targeted alteration of genomic sequences, where the
CC oligonucleotide has at least one mismatch compared with the genomic
CC sequence to be altered. In particular, these sequences are directed at
CC the following genes: adenosine deaminase, p53, beta-globin,

CC retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A
CC (CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus
CC 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6,
CC apolipoprotein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase
CC (UGT1), amyloid precursor protein (APC), presenilin-1 (PSEN1) and
CC presenilin-2 (PSEN2). These can be used in the gene therapy of diseases
CC such as cancer, adenosine deaminase deficiency, cystic fibrosis,
CC haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia,
CC Alzheimer's disease, melanoma, adenomatous polyposis of the colon and
CC various syndromes. The present sequence is one of the gene correcting
CC oligonucleotides of the invention

PS Claim 7; Page 176; 294pp; English.
XX
CC The present invention provides single-stranded oligonucleotides which can
CC be used for the targeted alteration of genomic sequences, where the
CC oligonucleotide has at least one mismatch compared with the genomic
CC sequence to be altered. In particular, these sequences are directed at
CC the following genes: adenosine deaminase, p53, beta-globin,
CC retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A
CC (CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus
CC 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6,
CC apolipoprotein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase
CC (UGT1), amyloid precursor protein (APC), presenilin-1 (PSEN1) and
CC presenilin-2 (PSEN2). These can be used in the gene therapy of diseases
CC such as cancer, adenosine deaminase deficiency, cystic fibrosis,
CC haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia,
CC Alzheimer's disease, melanoma, adenomatous polyposis of the colon and
CC various syndromes. The present sequence is one of the gene correcting
CC oligonucleotides of the invention

PS   Example 2; Page 284; 418pp; English.
XX
CC   The invention relates to a novel isolated nucleic acid encoding human
CC   KTOM1 (kidney tumour overexpressed membrane) protein. The protein of the
CC   invention has cytostatic activity. The nucleotide may have a use in gene
CC   therapy. The KTOM1 nucleic acids may be used to diagnose, treat or
CC   monitor a disease caused by altered expression of human KTOM1.
CC   Compositions comprising the nucleic acids, proteins or antibodies may be
CC   used to treat subjects having defects in KTOM1 which can manifest as
CC   cancer of the kidney, as well as a disorder of liver, bone marrow, brain,
CC   heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta
CC   function. The sequence represents a probe used in the invention to scan
CC   the nt 1-1001 portion of human KTOM1a (ABQ63232)

PT   Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL
PT   -1, useful for treating disorders associated with decreased expression or
```

```
PT   activity of human POSHL1.
XX
PS   Example 2; SEQ ID NO 957; 60pp + Sequence Listing; English.
XX
CC   The invention relates to an isolated SH3 domain (POSH)-like signalling
CC   protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino
CC   acids (S1, ABB83999), a sequence having 65% sequence identity to (S1),
CC   (S1) having 95% deviations, especially conservative substitutions or a
CC   fragment of the sequences comprising at least 8 contiguous amino acids.
CC   Human POSHL 1 is a proto-oncogene/oncogene product that functions as an
CC   adaptor protein that interacts with Rho family small GTPases as well as
CC   downstream components of the signal transduction pathway. (I) is useful
CC   for identifying a specific binding partner. (I) and nucleic acids (II)
CC   encoding (I) are useful for diagnosing, monitoring disease and treating
CC   caused by altered expression of human POSHL1 including diagnosing and
CC   treating cancer, they useful in the development of vaccines and (II) is
CC   useful in gene therapy. (II) is useful for constructing microarrays which
CC   are useful for measuring and for surveying gene expression and creating
CC   transgenic non-human animals capable of producing the proteins. The
CC   present sequence is that of a scanning oligonucleotide useful in examples
CC   of the invention. Note: The present sequence did not form part of the
CC   printed specification, but is based on sequence information supplied to
CC   Derwent by the European Patent Office

PT   Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL
PT   -1, useful for treating disorders associated with decreased expression or
PT   activity of human POSHL1.
XX
PS   Example 2; SEQ ID NO 959; 60pp + Sequence Listing; English.
XX
CC   The invention relates to an isolated SH3 domain (POSH)-like signalling
CC   protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino
CC   acids (S1, ABB83999), a sequence having 65% sequence identity to (S1),
CC   (S1) having 95% deviations, especially conservative substitutions or a
CC   fragment of the sequences comprising at least 8 contiguous amino acids.
CC   Human POSHL 1 is a proto-oncogene/oncogene product that functions as an
CC   adaptor protein that interacts with Rho family small GTPases as well as
CC   downstream components of the signal transduction pathway. (I) is useful
CC   for identifying a specific binding partner. (I) and nucleic acids (II)
CC   encoding (I) are useful for diagnosing, monitoring disease and treating
CC   caused by altered expression of human POSHL1 including diagnosing and
CC   treating cancer, they useful in the development of vaccines and (II) is
CC   useful in gene therapy. (II) is useful for constructing microarrays which
CC   are useful for measuring and for surveying gene expression and creating
CC   transgenic non-human animals capable of producing the proteins. The
CC   present sequence is that of a scanning oligonucleotide useful in examples
CC   of the invention. Note: The present sequence did not form part of the
CC   printed specification, but is based on sequence information supplied to
CC   Derwent by the European Patent Office

PT   Detecting a human parvovirus B19 infection in a biological sample to
PT   prevent viral transmission, comprises reacting a parvovirus B19 nucleic
PT   acid with a primer complementary to the 3'-terminal portion of the RNA
PT   target sequence.
XX
PS   Example 5; Page 53; 148pp; English.
XX
CC   The present invention describes a method for detecting a human parvovirus
CC   B19 infection in a biological sample. The method comprises reacting the
CC   isolated parvovirus B19 nucleic acid with a first oligonucleotide
CC   consisting of a first primer containing a complexing sequence
CC   sufficiently complementary to the 3'-terminal portion of the RNA target
CC   sequence to complex with. Also described: (1) amplifying a target
CC   parvovirus B19 nucleotide sequence; (2) a polynucleotide comprising one
CC   of 47 700 base pair sequences (see ABZ59549 to ABZ59569, and ABZ59604 to
CC   ABZ59629); (3) a polynucleotide comprising either of 2 4678 base pair
CC   sequences (see ABZ59570 and ABZ59571); (4) an oligonucleotide primer
CC   consisting of a promoter region recognised by a DNA-dependent RNA
CC   polymerase operably linked to a human parvovirus B19-specific complexing
CC   sequence of 10-75 nucleotides; (5) an oligonucleotide probe comprising a
CC   parvovirus B19-specific hybridising sequence of 10-50 nucleotides linked
CC   to an acridinium ester label; and (6) a diagnostic test kit comprising an
CC   oligonucleotide primer of (4), and instructions for conducting the
CC   diagnostic test. The method is useful for detecting parvovirus infection
CC   in a biological sample, such as in blood products, to prevent
CC   transmission of the virus through blood and plasma derivatives or by
CC   close personal contact. ABZ59549 to ABZ59634 and ABP57262 to ABP57267
CC   represent sequences used in the exemplification of the present invention

PT   New nucleic acid encoding human prostate membrane-specific antigen,
PT   useful e.g. for treatment of tumors and viral infection, also related
PT   polypeptide and antibodies.
XX
PS   Disclosure; Page 554; 771pp; French.
XX
CC   The invention relates to the isolation of 6327 nucleotide sequences,
CC   fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC   sequence having at least 80% identity, after optimal alignment, with the
CC   nucleotides, a sequence that hybridizes under stringent conditions with
CC   the nucleotides, or the complement, or corresponding RNA, of the
CC   nucleotides. The nucleotides are used as probes or primers for detecting,
CC   identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC   sense and antisense sequences, of nucleotides involved in tumour
CC   suppression or réversion, apoptosis and or viral resistance, to produce
CC   recombinant polypeptides, and to prepare transgenic animals, as
CC   experimental models. The nucleotides (also vectors containing them and
CC   cells containing the vectors), the encoded polypeptides and antibodies
CC   (Ab) against the polypeptide are useful for prevention and/or treatment
CC   of viral infections or diseases characterized by development of tumours
CC   or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC   Analysis of the expression of the nucleotides can be used for diagnosis
CC   and/or prognosis of these diseases. The nucleotides and polypeptides can
```

```
CC   also be used to screen for their specific interactive molecules,
CC   potentially useful for treating diseases associated with abnormal
CC   expression of the nucleotides.

PT   New acid resistant polymer complementary to phosphodiesterase 4 for
PT   treating depression, thrombosis, cystic fibrosis, gastric lesions,
PT   pulmonary hypertension, glaucoma, multiple sclerosis, atopic dermatitis
PT   and asthma.
XX
PS   Claim 7; Page 16; 48pp; English.
XX
CC   The present sequence represents an antisense oligonucleotide, directed
CC   against the phosphodiesterase 4C (PDE4C) gene. The oligonucleotide is
CC   used to construct the polymer of the invention. The specification
CC   describes an acid resistant polymer which is complementary to PDE4, and
CC   comprises a nucleic acid with a backbone structure that is modified from
CC   that of a naturally occurring nucleotide polymer and a blocking chemical
CC   modification at or near one end of the nucleic acid. The acid resistant
CC   polymer is characterized by a pH stability of an hour at pH 0.01 to 10
CC   and a nuclease resistance of twice that of naturally occurring nucleic
CC   acids which have the same number of nucleotides. The polymers are used to
CC   inhibit the expression of genes encoding PDE4. They are useful as
CC   analytical tools in the study of individual PDE isoforms and can treat
CC   depression, thrombosis, cystic fibrosis, gastric lesions, pulmonary
CC   hypertension, glaucoma, multiple sclerosis, atopic dermatitis, asthma,
CC   and other allergic disorders. Other illnesses in which an increase of
CC   cyclic AMP or decrease in phosphodiesterase levels is useful, can also be
CC   treated

XX
PT   Porcine stem cells comprising a marker gene under an Oct-4 promoter.
XX
PS   Example 1; Page 15; 69pp; English.
XX
CC   This sequence describes novel methods where a genetic selectable marker
CC   construct operatively linked to a porcine promoter is introduced into a
CC   source of cells that contain porcine stem cells under conditions that
CC   allows for differential expression of the marker and hence the selective
CC   isolation and/or propagation of desired porcine stem cells. The methods
CC   are used to isolate and/or enrich and/or selectively propagate
CC   pluripotent porcine cells and to genetically modify porcine cells. The
CC   embryonic stem cells could be altered so as to not express a cell surface
CC   membrane protein that may cause rejection of porcine cells after
CC   xenotransplantation. Transgenic pigs generated through the modified
CC   porcine stem cells are useful for providing organs suitable for
CC   transplants. The methods overcome the problem of prior art methods
CC   associated with the continuing presence of certain differentiated cell
CC   types that can cause elimination of stem cells from the culture by
CC   inducing their differentiation of programmed cell death. The invention
CC   specifically describes the use of the porcine Oct-4 promoter
CC   polynucleotide sequence

PT   New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves
PT   RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1,
PT   PCNA and Cyclin B1.
XX
PS   Disclosure; Page 80; 109pp; English.
XX
CC   The present invention relates to a hairpin or hammerhead ribozyme,
CC   designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase
CC   other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
CC   Representative examples of ribozyme recognition sites are given in
CC   AAA82415 to AAA86787. The ribozyme of the invention is useful for
CC   inhibiting restenosis by introduction of the ribozyme into cells. The
CC   ribozyme is resistant to endonuclease activity and hence is efficient in
CC   restenosis treatment

PT   New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves
PT   RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1,
PT   PCNA and Cyclin B1.
XX
PS   Disclosure; Page 80; 109pp; English.
XX
CC   The present invention relates to a hairpin or hammerhead ribozyme,
CC   designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase
CC   other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
CC   Representative examples of ribozyme recognition sites are given in
CC   AAA82415 to AAA86787. The ribozyme of the invention is useful for
CC   inhibiting restenosis by introduction of the ribozyme into cells. The
CC   ribozyme is resistant to endonuclease activity and hence is efficient in
CC   restenosis treatment

PT   Treating proliferative skin or eye diseases and scarring, using ribozymes
PT   that cleave RNA encoding cytokines involved in inflammation, matrix
PT   metalloproteinases, growth factors and cell-cycle dependent kinases.
XX
PS   Example 1; Page 235; 408pp; English.
XX
CC   The present invention describes a method for treating a proliferative
CC   skin or eye disease and scarring. The method involves administering a
CC   ribozyme (I) which cleaves RNA encoding a cytokine involved in
CC   inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
CC   dependent kinase, growth factor or a reductase, or administering a
CC   nucleic acid molecule (II) comprising a promoter operably linked to a
CC   nucleic acid segment encoding (I). (I) can have antipsoriatic,
CC   dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,
CC   ophthalmological, vulnerary, keratolytic and virucide activities, and
CC   cleaves RNA encoding cytokine involved in inflammation. (I) can be used
CC   in gene therapy. (I) and (II) are useful for treating proliferative skin
CC   diseases such as psoriasis, atopic dermatitis, actinic keratosis,
CC   squamous or basal cell carcinoma and viral or seborrheic wart. They can
CC   also be used for treating proliferative eye diseases such as diabetic
CC   retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
CC   prematurity and retinal detachment, and for treating and preventing
CC   scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
CC   scar. AAH57577 to AAH62099 represent sequences used in the
CC   exemplification of the present invention

PT disorders associated with altered PTP1B signal transduction, e.g.
PT diabetes or cancer.
XX
PS Example 3; SEQ ID NO 276; 234pp; English.
XX
CC The invention relates to a novel isolated small interfering RNA (siRNA)
CC polynucleotide, comprising at least one nucleotide sequence from any of
CC the 20 fully defined sequences given in the specification. The invention
CC further relates to: a pharmaceutical composition comprising a new siRNA
CC polynucleotide and a physiological carrier; a recombinant nucleic acid
CC construct, comprising a polynucleotide that is capable of directing
CC transcription of an siRNA; a host cell transformed or transfected with
CC the above recombinant nucleic acid construct; a method for interfering
CC with expression of a protein tyrosine phosphatase (PTP)1B polypeptide, or
CC its variant; a method for identifying a component of a PTP1B signal
CC transduction pathway; a method for modulating an insulin receptor protein
CC phosphorylation state in a cell; a method for altering a Jak2 protein
CC phosphorylation state in a cell; and a method for treating a Jak2-
CC associated disorder. The siRNA has the following activities:
CC antidiabetic, anorectic, antiinflammatory, neuroprotective, cytostatic,
CC immunosuppressive, and antimicrobial. The novel siRNA polynucleotides can
CC be used in gene therapy to treat disorders. The composition and methods
CC are useful in treating disorders associated with PTP1B-mediated signal
CC transduction, such as diabetes, obesity, hyperglycaemia-induced
CC apoptosis, inflammation, neurodegenerative disorders, cancer, autoimmune
CC diseases or infection. This polynucleotide sequence represents an siRNA
CC used for modulating the signal transduction of a protein tyrosine
CC phosphatase of the invention.

PT   Detecting or quantifying bacteria of Cycloclasticus genus, useful for
PT   detecting petroleum degrading microbes, involves amplifying gene encoding
PT   beta-subunit of DNA gyrase.
XX
PS   Claim 1; SEQ ID NO 2; 13pp; Japanese.
XX
CC   The invention relates to a novel method for detecting or quantifying
CC   bacteria of Cycloclasticus genus involves amplifying the gene encoding
CC   the beta-subunit of DNA gyrase. The novel method is useful for detecting
CC   the microbial-flora structure of petroleum-degrading microorganisms at
CC   the time of an offshore oil contamination. This polynucleotide sequence
CC   represents a primer used in the exemplification of the invention.

XX
PT   Detecting sequence of RNA interference useful for synthesizing siRNA, by
PT   detecting regions in sequence fulfilling specific criteria such as base
PT   at 3' terminal is adenine, thymine or uracil, base at 5' terminal is
PT   guanine or cytosine.
XX
PS   Disclosure; SEQ ID NO 857; 325pp; Japanese.
XX
CC   The invention relates to a method of detecting the base sequence for RNA
CC   interference by detecting the regions in the DNA sequence fulfilling the
CC   following requirements such as: (i) the base at 3' terminal is adenine,
CC   thymine or uracil; (ii) the base at 5' terminal is guanine or cytosine;
CC   (iii) the seven base sequence at 3' terminal is rich in adenine, thymine
CC   and uracil, and; (iv) there are bases in a such a number that it causes
CC   RNA interference without showing cytotoxicity. The method is used for
CC   designing and synthesizing siRNA causing RNA interference. This sequence
CC   corresponds to an RNA interference target sequence of the invention.

PT   New nucleic acid encoding cyclic-GMP stimulated nucleotide phospho-
PT   di:esterase - and related vectors and transformed cells, useful for
PT   screening cpds. for phospho-di:esterase modulating activity.
XX
PS   Example 1; Col 9; 69pp; English.
XX
CC   AAQ83955 and AAQ83956 are a pair of primers for the PCR amplification of
CC   a nucleotide sequence encoding a bovine brain cyclic-GMP stimulated
CC   nucleotide phospho-diesterase (CaM PDE). Eukaryotic cells that express
CC   CaM PDE can be used to screen cpds. for the ability to modulate CaM PDE
CC   activity. CaM PDEs are involved in regulating the transmission of
CC   information from hormones, neurotransmitters or other systems that use
CC   cyclic nucleotides as messengers. Antibodies raised against CaM PDE can
CC   be used for enzyme purifcn., or determination. (Updated on 25-MAR-2003 to
CC   correct PF field.)

PS   Disclosure; Col 43-44; 96pp; English.
XX
CC   The invention relates to new oligonucleotide probes and primers used for
CC   the detection of human papillomaviruses (HPV) which are not genital types
CC   6, 11, 16, 18 or 33. The probes and primers AAT44608-T44693 are esp. used
CC   to detect HPV types 26, 31, 31B, 35, 39, 40, 43, 45, 51-59 and 68. The
CC   primers can be used to detect these HPV types in conjunction with the
CC   consensus primers and typing probes AAT44733-T44906, which are based on
CC   and amplify fragments of the L1, E6, E7 and E1 regions of the HPV
CC   sequences. Detection of the amplification prods. is done with probes
CC   derived from consensus sequences found in all characterised HPV
CC   sequences. The negative strand primers AAT44862-9 are used with the
CC   positive strand primers AAT44859-62 to amplify a region of the E1 region
CC   of HPV sequences. However the E1 region is well conserved between among
CC   HPVs so detection of the E1 region is more readily accomplished when the
CC   E6 or E7 region is included. Thus the primers can be used with the E6 and
CC   E7 primers AAT44813-32. Detection of these E6/E1 or E7/E1 amplification
CC   prods. uses probes AAT44870-1. (Updated on 25-MAR-2003 to correct PF
CC   field.)

XX
CC   AAT51092 and AAT51093 represent amplification primers for the coding
CC   sequence for the calcium/calmodulin dependent phosphodiesterase (CaM-PDE)
CC   isolated from bovine brain (see AAT51094). The cyclic nucleotide
CC   phosphodiesterases (PDEs) catalyse the hydrolysis of 3', 5' cyclic
CC   nucleotides, such as cAMP and cGMP, to their corresponding 5'-nucleotide
CC   monophosphates. The PDEs are therefore important in the control of the
CC   cellular concentration of cyclic nucleotides. The PDEs are, in turn,
CC   regulated by transmembrane signals or second messenger ligands such as
CC   calcium ion or cGMP. The PDEs therefore have a central role in regulating
CC   the flow of information from extracellular hormones, neurotransmitters,
CC   or other signals that use the cyclic nucleotides as messengers. PDEs are
CC   present in most of the cells and tissues of eukaryotic organisms, but
CC   only in trace amounts. CaM-PDEs are responsive to intracellular calcium,
CC   which leads to a decreased intracellular concentration of cAMP, and/or
CC   cGMP. The amplified sequence can be used for the production of
CC   recombinant CaM-PDE, which may have therapeutic and diagnostic uses. The
CC   encoded protein may also be useful for diagnostic antibody production.

PT   Identification of modulators of Calcium/calmodulin sensitive cyclic
PT   nucleotide phosphodiesterase - uses recombinant cells expressing the
PT   enzyme and monitoring protein expression in the presence of potential
PT   modulators.
XX
PS   Example 1; Col 8; 69pp; English.
XX
CC   PCR primers AAV54738-39 were used to amplify DNA encoding the 61 kDa
CC   Ca2+/calmodulin sensitive cyclic nucleotide phosphodiesterase (CaM-PDE)
CC   from bovine brain. CaM-PDE enzymes catalyse the hydrolysis of cyclic
CC   nucleotides and as such control their intracellular level. They are
CC   controlled by second messengers e.g. Ca2+ and calmodulin and
CC   transmembrane signals and through pathways involving these, regulate flow
CC   of information from extracellular hormones, neurotransmitters and other
CC   signals using cyclic nucleotides as messengers. The specification
CC   describes an assay for identifying a chemical agent which modifies the
CC   enzymatic activity of a mammalian CaM-PDE. The assays are useful for
CC   identifying modulators of CaM-PDEs. The assay is carried out by
CC   incubating cells expressing CaM-PDE with the suspected modulator and
CC   measuring its effect e.g. monitoring the hydrolysis of cAMP and/or cGMP

PT New calmodulin and calcium stimulated cyclic nucleotide phosphodiesterase
PT - used e.g to identify selective modulators, potentially useful as e.g.
PT cardiotonic, antidepressant, antihypertensive agents.
XX
PS Example 1; Col 8; 69pp; English.
XX
CC PCR primers AAV36135-36 were used to amplify a 612 bp cDNA fragment from
CC bovine brain encoding calcium ion/calmodulin stimulated cyclic nucleotide
CC phosphodiesterase (CaM-PDE) polypeptide. The full length CaM-PDE cDNA is
CC 61 kDa (see AAV36137). CaM-PDEs are characterised by their responsiveness
CC to intracellular calcium, which leads to a decreased intracellular
CC concentration of cAMP and/or cGMP. CaM-PDEs, and their fragments or
CC synthetic peptides, are used in therapy, prognosis and diagnosis. They
CC are also used to generate specific antibodies useful as immunoassay
CC reagents for detecting the protein or for affinity purification and for
CC identifying specific modulators of CaM-PDE activity. CaM-PDEs are
CC implicated in signalling involving extracellular hormones and
CC neurotransmitters, so selective inhibitors are potentially useful as
CC cardiotonic, antidepressant, antihypertensive and antithrombotic agents

PT Assay for inhibitors of cyclic guanidine monophosphate-stimulated
PT nucleotide phosphodiesterase, potentially useful as cardiotonic agents,
PT from their ability to alter a heat-shock phenotype.
XX
PS Example I; Col 8; 69pp; English.
XX
CC The invention relates to purified and isolated nucleotide sequences
CC encoding mammalian Ca2+/calmodulin-stimulated phosphodiesterases (CaM-
CC PDEs) and cyclic guanidine monophosphate (cGMP)-stimulated
CC phosphodiesterases (cGS-PDEs). In particular the invention relates to an
CC assay for identifying chemicals that modify the enzymatic activity of a
CC mammalian cGS-PDE. The PDEs catalyse the hydrolysis of of cyclic

CC nucleotides to their corresponding 5'-nucleoside monophosphates. In this
CC way they control the cellular concentration of cyclic nucleotides,
CC thereby regulating the flow of information from extracellular hormones,
CC neurotransmitters or other signals that use cyclic nucleotides as
CC messengers. The PDEs in turn are regulated by transmembrane signals or
CC second messsenger ligands such as Ca2+ or cGMP. Inhibitors of these
CC enzymes are potentially useful as cardiotonics, antidepressants,
CC antihypertensives or antithrombotics. The method of the invention can
CC identify specific inhibitors of particular isoforms of cGS-PDEs.
CC Sequences AAZ90360, AAZ90367, AAZ90370, AAZ90372, AAZ90377, AAZ90380-
CC Z90381 and AAZ90383-Z90385 represent cDNA clones encoding isoforms of CaM
CC -PDEs and cGS-PDEs from bovines and humans. The present sequence
CC represents a PCR primer used in an exemplification of the present
CC invention to isolate and amplify DNA encoding a PDE

PT Antisense oligonucleotide, useful for modulating human cyclin E gene
PT expression and inhibiting cellular proliferation caused by restenosis and
PT cancer, has a sequence complementary to the 5' or 3' untranslated region
PT of cyclin E gene.
XX
PS Claim 3; Page 13; 52pp; English.
XX
CC Sequences AAF27128-AAF27139 represent antisense oligonucleotides
CC targetted to the 5' or 3' UTR (untranslated region) of the human cyclin E
CC gene. Cyclin E is a G1 phase cell cycle protein which regulates the entry
CC of cells into the S phase. The antisense oligonucleotides of the
CC invention inhibit the expression of cyclin E, thereby inhibiting cellular
CC proliferation. The antisense oligonucleotides are useful for inhibiting
CC or preventing cellular proliferation, and can thus be used in the
CC treatment of restenosis, cancer and psoriasis. The antisense
CC oligonucleotides are also useful for the manufacture of a medicament for
CC inhibiting cellular proliferation

PT Map of wheat D genome comprising the genome location of a microsatellite
PT marker, useful for e.g. identifying genes responsible for a desired
PT phenotypic trait, especially quantitative trait loci in wheat, and
PT diseases.
XX
PS Claim 4; Page 10; 105pp; English.
XX
CC The invention relates to a map of the bread wheat D genome comprising the
CC genome location of a microsatellite marker selected from a group of 185
CC such markers (ABQ92733-ABQ92917). The invention also encompasses the use
CC of left (ABQ92918-ABQ93102) and right (ABQ93103-ABQ93287) primers to
CC amplify and detect the microsatellite markers, and to identify genes
CC responsible for a phenotypic trait of interest in wheat. Wheat is an
CC allohexaploid species consisting of 3 diploid genomes designated A, B and
CC D, resulting from two successive intercrossings involving at least three
CC different species. The D genome is thought to have been introduced in the
CC most recent intercrossing, between the amphiploid AABB and Triticum
CC tauschii (DD), probably involving only a limited number of genotypes of
CC both species. Due to its polyploid genome, the large size of its genome,
CC and its low level of polymorphism, the genetic mapping of wheat has to
CC date been difficult. Microsatellites are tandemly repeated sequences
CC between one and six nucleotides long, and are very polymorphic in length,
CC mainly due to polymerase slippage during replication. This high degree of
CC polymorphism makes them especially suitable for the genetic mapping of
CC species which show little intraspecies polymorphism, such as wheat. In
CC addition, microsatellites are codominant, and exhibit Mendelian

```
CC   inheritance. The 185 microsatellite markers of the invention are
CC   developed from the ancestral diploid donor species Triticum tauschii and
CC   map to the wheat D genome, which is less polymorphic than the A or B
CC   genomes. These microsatellite markers thus help to overcome some of the
CC   problems associated with the genetic mapping of wheat. The wheat D genome
CC   map and the microsatellite markers and associated primers of the
CC   invention are useful for identifying genes responsible for a phenotypic
CC   trait of interest, most notably QTLs (quantitative trait loci). In
CC   particular they may be used for analysing genes and alleles implicated in
CC   disease and for identifying development factors, quality factors and
CC   factors conferring resistance to pathogens and xenobiotics. The
CC   microsatellite markers, and associated primers may be also be used in
CC   mapping and genotyping diploid and polyploid species of Triticum,
CC   particularly Aegilops, Triticum monococcum, Triticum durum, Triticum
CC   aestivum, or related species; for identifying cultivars and hybrids of
CC   Triticum and related species; to assess whether or not a product
CC   comprises wheat or a related species; and to assess whether or not a
CC   product comprises genetically modified wheat. The present sequence
CC   represents a specifically claimed Triticum tauschii/wheat genome D
CC   microsatellite marker right PCR primer of the invention. (Updated on 29-
CC   AUG-2003 to standardise OS field)

PT   New purified and isolated DNA sequence encoding a mammalian
PT   calcium/calmodulin- or cyclic GMP-stimulated cyclic nucleotide
PT   phosphodiesterase polypeptide, useful for therapeutic, diagnostic and
PT   prognostic applications.
XX
PS   Example 1; Page 5; 71pp; English.
XX
CC   The invention relates to purified and isolated polynucleotide sequence
CC   encoding a mammalian Ca^2+/calmodulin- or cyclic GMP-stimulated cyclic
CC   nucleotide phosphodiesterase polypeptide (CaMP-PDE and cGS-PDE). Also
CC   included are a DNA vector comprising the novel DNA sequence, a host cell
CC   transformed with the polynucleotide sequence, a polypeptide product of
CC   the expression in the transformed host cell, an antibody specifically
CC   immunoreactive with the polypeptide and assay methods for identifying a
CC   chemical agent which modifies the enzymatic activity of a mammalian CaMP-
CC   PDE or cGS-PDE. Disclosed are the cDNA and protein sequences of bovine
CC   59KDa CaM-PDE, 61kDa CaM-PDE, 63kDa CaM-PDE, cGS-PDE and human 61kDa CaM-
CC   PDE and cGS-PDE. The DNA sequence is useful for producing a polypeptide
CC   having the enzymatic activity of a mammalian CaM-PDE or cGS-PDE which is
CC   used in therapeutic, diagnostic and prognostic applications and in the
CC   preparation of antibodies. Isolated chemical agents which are inhibitors
CC   of PDEs may have anti-depressant, anti- hypertensive or anti-thrombotic
CC   activities or may be cardiotonic agents. The present sequence is a PCR
CC   primer used in the isolation of the CaM-PDE or cGS-PDE cDNAs of the
CC   invention

CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

```
PS   Claim 15; SEQ ID NO 4941; 763pp; English.
XX
CC   This invention describes a novel composition (a) a first active agent,
CC   comprising oligonucleotides, effective for alleviating
CC   bronchoconstriction, respiratory tract inflammation, allergies and
CC   reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC   surfactant depletion or hyposecretion, when administered to a mammal. The
CC   oligonucleotides are derived from a gene encoding or regulating
CC   expression of a target polypeptide associated with lung airway or lung
CC   dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC   The invention also describes a kit, that comprises: (a) a delivery
CC   device, in separate containers, (b) the oligonucleotides, (c)
CC   instructions for adding a carrier and for use of the kit. The composition
CC   of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC   analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC   beta-adrenergic agonist. The composition is useful for preventing or
CC   treating a respiratory, lung or malignant disease. The administered
CC   composition comprises oligo and is administered to reduce the production
CC   or availability, or to increase the degradation of the target mRNA or to
CC   reduce the amount of target polypeptide present in the lungs. The
CC   pulmonary obstruction, and/or bronchoconstriction and/or lung
CC   inflammation, allergies and/or surfactant hypoproduction are associated
CC   with a disease or condition such as pulmonary vasoconstriction,
CC   inflammation, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC   transplantation rejection, pulmonary infections, bronchitis or cancer.
CC   The reduced adenosine content of the anti-sense oligos corresponding to
CC   thymidines present in the target RNA serves to prevent the breakdown of
CC   the oligonucleotides into products that free adenosine into the system
CC   e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC   prevent any unwanted effects due to it

PT   New antisense compound, having a sequence targeted to a nucleic acid
PT   encoding endothelial specific molecule-1 (ESM-1), useful for preparing a
PT   composition for treating e.g., diabetes, cancer or cardiovascular
PT   disorder.
XX
PS   Claim 3; SEQ ID NO 1721; 555pp; English.
XX
CC   The invention describes a new antisense compound, having a sequence
CC   comprising 8-30 bp targeted to a nucleic acid encoding endothelial
CC   specific molecule-1 (ESM-1), that specifically hybridises with the
CC   nucleic acid ESM-1 and inhibits its expression. Also described are: a
CC   composition; inhibiting the expression of ESM-1 in cells or tissues; and
CC   treating an animal having a disease or condition associated with ESM-1.
CC   The compound is useful for preparing a composition for treating diabetes,
CC   cancer, ischaemia or reperfusion injury, or angiogenic, immunological,
CC   cardiovascular or neurological disorder. This sequence represents an
CC   antisense oligonucleotide that can be used to modulate expression of
CC   endothelial specific molecule-1 (ESM-1).

PT   Novel mammalian calcium/calmodulin stimulated cyclic phosphodiesterase
PT   nucleotide sequence useful for identifying chemical agent that modifies
PT   enzymatic activity of calcium/calmodulin stimulated cyclic
PT   phosphodiesterase polypeptide.
XX
PS   Example 1; SEQ ID NO 1; 72pp; English.
XX
CC   The present invention provides a mammalian Ca 2+/ calmodulin stimulated
CC   cyclic nucleotide phosphodiesterase (CaM-PDE) and cyclic-guanosine
CC   monophosphate (cGMP) stimulated cyclic nucleotide phosphodiesterase (cGS-
CC   PDE) polypeptide and its polynucleotide. The invention is useful for
CC   producing a polypeptide having enzymatic activity of mammalian CaM-PDE
CC   and cGS-PDE. The invention is also useful for identifying a chemical
CC   agent that modifies the enzymatic activity of mammalian CaM-PDE and cGS-
CC   PDE. The present sequence is bovine CaM-PDE DNA amplifying PCR primer.

PT   Novel telomerase associated polypeptide(s) and related nucleic acid -
PT   useful for detecting e.g. tumour cells or pathogens.
XX
PS   Claim 39; Page 10; 349pp; English.
XX
CC   This sequence encodes the Saccharomyces cerevisiae telomerase RNA
CC   template sequence, and is present in the TLC1 (telomerase component-1,
CC   STR2) gene (AAT27045). Telomerase is a ribonucleoprotein required for
CC   telomere replication. The CA-rich template sequence allows a GT-rich
CC   sequence (AAT27054) to be inserted into the telomere via reverse
CC   transcription, for subsequent elongation by telomerase. The sequence may
CC   be used to detect non-ciliate telomerase-associated genes, e.g. in
CC   tumour, pathogen, sperm or ovum cells. New telomerase-associated
CC   sequences may be detected by a reporter gene expression system linked to
CC   an expression-repressing telomere sequence, and binding compounds, e.g.
CC   antibodies, may be detected by complex formation with telomerase
CC   components. The products may be used as antitumour, antiseptic or
CC   contraceptive agents, in infertility diagnosis, or in gene therapy

XX
PT   New hairpin ribozyme - for inhibiting replication and infectivity of
PT   hepatitis B virus.
XX
PS   Example 1; Page 17; 34pp; English.
XX
CC   A new hairpin ribozyme has been developed which is able to inhibit
CC   replication and infectivity of hepatitis B virus (HBV). The present
CC   sequence represents a hairpin ribozyme recognition site in human HBV. The
CC   hairpin ribozyme, and the nucleic acid encoding it, can be introduced
CC   into a cell infected with HBV, or susceptible to infection, to inhibit
CC   the replication/infectivity of HBV. Alternatively, cells transduced with
CC   a vector ex vivo are administered to a patient. Hairpin ribozymes act on
CC   pregenomic RNA and so are potentially capable of eliminating
CC   (extra)hepatic replication and transport of HBV in all infected patients,
CC   including chronic carriers. Also infection by hepatitis D (which requires
CC   HBV surface antigen as its envelope) is prevented

PT   Artificial chromosome with mammalian type telomere sequence - useful in
PT   genetic engineering and gene therapy.
XX
PS   Example 2; Page 8; 18pp; Japanese.
XX
CC   The present sequence represents a primer used for in vitro mutagenesis,
CC   used in an example of the present invention. The present invention
CC   describes an artificial chromosome having an added mammalian type
CC   telomere sequence at the end terminal. The hybrid telomerase comprises an
CC   RNA containing a sequence complimentary to a mammalian type telomere
CC   sequence, and a telomerase protein of non-mammalian biological origin.
CC   Preparation of a hybrid telomerase comprises producing a RNA containing a
CC   sequence complimentary to a mammalian type telomere sequence in a non-
CC   mammalian host. The method, which is useful in genetic engineering and
CC   gene therapy is useful for the preparation of hybrid telomerase and
CC   artificial chromosomes

PT   New enzymatic nucleic acid molecules - cleave RNA produced by e.g. c-myb,
PT   for treating restenosis or cancer.
XX
PS   Claim 1; Page 69; 128pp; English.
XX
CC   The present sequence represents the preferred target sequence for an
CC   enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves
CC   the human c-myb sequence at the base position indicated in the descriptor
CC   line. The c-myb sequence was screened for optimal ribozyme target sites
CC   using a computer folding algorithm, and regions of the mRNA which did not
CC   form secondary folding structures and contained potential ribozyme
CC   cleavage sites were identified. Ribozymes were synthesised and their
CC   activities optimised by either varying the length of the binding arms or
CC   by modification to prevent degradation by nucleases. The ribozymes cleave
CC   the c-myb sequence and can be used to prevent smooth muscle cell
CC   hyperproliferation in restenosis, especially after coronary angioplasty,
CC   and in cancers

PT   Enzymatic nucleic acid molecules having a hammer-head motif - used for
PT   the treatment of arthritis, induction of graft tolerance or treatment of
PT   auto-immune diseases.
XX
PS   Example 1; Page 155; 307pp; English.
XX
CC   The present invention describes a novel enzymatic nucleic acid (ENA)
CC   having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
CC   ; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least
CC   ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
CC   can inhibit collagenase and stromelysin production in the synovial
CC   membrane of joints for the treatment or prevention of arthritis,
CC   particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
CC   be used to treat antigen presenting cells of a donor to induce tolerance
CC   in a recipient to an alloantigen of a donor. They can also be used for
CC   enhancing graft tolerance or for treating autoimmune disease, and for
CC   treating allergies and other inflammatory conditions. The ENA's can also
CC   be used in diagnosis. Ribozyme therapy impacts on the expression of
CC   stromelysin without introducing the non-specific effects upon gene
CC   expression which accompany treatment with retinoids and dexamethasone.
CC   The concentration of ribozyme required to affect a therapeutic treatment
CC   is lower than that required of antisense molecules, and is highly
CC   specific. The present sequence is used in the exemplification of the
CC   present invention

PT   Enzymatic nucleic acid molecules having a hammer-head motif - used for
PT   the treatment of arthritis, induction of graft tolerance or treatment of
PT   auto-immune diseases.
XX
PS   Example 1; Page 156; 307pp; English.
XX
CC   The present invention describes a novel enzymatic nucleic acid (ENA)
CC   having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
CC   ; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least
CC   ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
CC   can inhibit collagenase and stromelysin production in the synovial
CC   membrane of joints for the treatment or prevention of arthritis,
CC   particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
CC   be used to treat antigen presenting cells of a donor to induce tolerance
CC   in a recipient to an alloantigen of a donor. They can also be used for
CC   enhancing graft tolerance or for treating autoimmune disease, and for
CC   treating allergies and other inflammatory conditions. The ENA's can also
CC   be used in diagnosis. Ribozyme therapy impacts on the expression of
CC   stromelysin without introducing the non-specific effects upon gene
CC   expression which accompany treatment with retinoids and dexamethasone.
CC   The concentration of ribozyme required to affect a therapeutic treatment
CC   is lower than that required of antisense molecules, and is highly
CC   specific. The present sequence is used in the exemplification of the
CC   present invention

CC   The present invention describes enzymatic nucleic acid molecules with RNA
CC   -cleaving activity (e.g. ribozymes) which are capable of modulating the
CC   expression of plant genes: (i) involved in biosynthesis of alkaloids; or
CC   (ii) involved in flower formation. AAV95982 to AAV96334, and AAV96335 to
CC   AAV96354 represent potato solanidine glucosyltransferase hammerhead and
CC   hairpin ribozymes, respectively. AAV95629 to AAV95981, and AAV96355 to
CC   AAV96734 represent potato solanidine glucosyltransferase target
CC   sequences. AAV96773 to AAV97170, and AAV97171 to AAV97195 represent
CC   potato citrate synthase hammerhead and hairpin ribozymes, respectively.
CC   AAV96735 to AAV96772, and AAV97196 to AAV97220 represent potato citrate
CC   synthase target sequences. Ribozymes of the present invention can be used
CC   to inhibit the synthesis of toxic alkaloids in solanaceous plants,
CC   particularly potato but also tomato, pepper, aubergine and ditura or to
CC   inhibit flowering in potato, lettuce, spinach, cabbage, brussel sprouts,
CC   arugula, kale, collards, chard, beet, turnip, sweet potato and turf
CC   grass. Also the ribozymes can be used for RNA manipulation in the same
CC   way that restriction endonucleases are for DNA, as well as to examine
CC   genetic drift and mutations in plants and to detect specific RNA. The
CC   ribozymes can be targeted to specific genes or to consensus sequences
CC   within a family of related genes, and being catalytic need to be present
CC   at only very low concentrations

PT   Preparation of antisense oligo:nucleotide(s) which lack long runs of
PT   consecutive guanosine or inosine - and have specific ratio of residues
PT   able to form two or three hydrogen bonds, have greater activity and
PT   reduced toxicity, used therapeutically or to modulate growth of cells in
PT   culture.
XX
PS   Example 4; Fig 6d; 286pp; English.
XX
CC   AAV48709-886 represent antisense oligonucleotides directed against the
CC   ErbB-2 gene. Of these, only oligonucleotides AAV48709-91 resulted in
CC   significant redcution in ErbB-2 protein expression, while
CC   oligonucleotides AAV48792-886 had little effect. The oligonucleotides
CC   exemplify the invention. The specification describes oligonucleotides
CC   that contain 8-30 nucleotides, which contain at most 8 nucleotides that
CC   can each form three hydrogen bonds to cytosine; do not contain four
CC   consecutive nucleotides able to form three H-bonds each to four
CC   consecutive cytosines; do not contain two sequences of three consecutive
CC   nucleotides each able to form three H-bonds to three consecutive
CC   cytosines, and the ratio between residues able to form two H-bonds each
CC   (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The
CC   oligonucleotides are used to modulate expression of genes, particularly
CC   the genes for p53, ErB-2, junB, junD, TGF-beta 1 or beta 2 to control
CC   proliferation of primary cell cultures (e.g. bone marrow stem, liver or
CC   kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The
CC   oligonucleotides can also be used to analyse function of proteins (by
CC   altering their expression or activity) and therapeutically, e.g. in cases
CC   of cancer or (targeting TGF) for stimulating the immune system

PT   Novel ribozymes for modulating the synthesis, expression and/or stability
PT   of an mRNA encoding an angiogenic factors.
XX
PS   Claim 56; Page 98; 305pp; English.
XX
CC   The present invention describes enzymatic nucleic acid molecules with RNA
CC   cleaving activity, which specifically cleave RNA encoded by an aryl
CC   hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3
CC   gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to
CC   AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT,
CC   and AAA17168 to AAA17560 and AAA17623 to AAA17684 represent their
CC   corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to
CC   AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086
CC   and AAA19155 to AAA19222 represent their corresponding target sequences;
CC   AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme
CC   sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and
CC   AAA21596 to AAA21688 represent their corresponding target sequences;
CC   AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequence
CC   for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to
CC   AAA23422 represent their corresponding target sequences. The ribozymes of
CC   the invention are used for modulating the synthesis, expression and/or
CC   stability of an mRNA encoding angiogenic factor, especially ARNT,
CC   integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are
CC   especially used to treat cancer, diabetic retinopathy, age related
CC   macular degeneration (ARMD), inflammation, and arthritis, as well as
CC   neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris,
CC   angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber
CC   syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome,
CC   and other syndromes and diseases related to the levels of ARNT, Tie-2,
CC   integrin subunit alpha-6, or integrin subunit beta-3

XX
PT   New nucleic acids that interact, and optionally cleave, target sequences,
PT   used to treat cancer.
XX
PS   Claim 77; Page 68; 148pp; English.
XX
CC   The present invention describes nucleic acids (A) that interact stably
CC   with a target sequence and contain at least one phosphoro(di)thioate
CC   link, having endonuclease activity. (A), and more generally any catalytic
CC   nucleic acid (A') that modulates expression of the oestrogen receptor
CC   gene, are used to treat cancer (particularly of breast or endometrium),
CC   in vivo or by transforming cells ex vivo and implanting treated cells, or
CC   for other conditions associated with levels of oestrogen receptor.
CC   Because of the high selectivity for targeted RNA, (A) can also be used to
CC   correlate inhibition of gene expression with alterations in phenotype,
CC   particularly for identification of therapeutic targets, and as research
CC   reagents (for RNA, in the same way that restriction endonucleases are
CC   used with DNA). The combination of modifications in (A) improves
CC   resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC   AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC   AAA24748 to AAA25992 represent their corresponding target sequences.
CC   AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC   sequences, and AAA26107 to AAA26218 represent their corresponding target
CC   sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
CC   antisense oligonucleotides used in the exemplification of the present
CC   invention

PT   Enzymatic and antisense nucleic acid inhibition of repressor genes,
PT   useful for producing e.g. granulocyte colony stimulating factor protein,
PT   interferon alpha and erythropoietin.
XX
PS   Claim 37; Page 91; 164pp; English.
XX
CC   The present invention relates to enzymatic and antisense nucleic acid
CC   molecules that act as inhibitors of the expression of repressor genes
CC   encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription
CC   factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP).
CC   Inhibition of the repressors removes prevents inhibition (and
CC   consequently increases expression of) genes involved in the production of
CC   erythropoietin, granulocyte colony stimulating factor protein and
CC   interferon alpha

PT Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
PT constructs, which down regulate expression of a CD20 gene or neurite
PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
PT central nervous system injury.
XX
PS Claim 30; Page 148; 200pp; English.
XX
CC The invention relates to a nucleic acid molecule which down regulates
CC expression of a CD20 gene and a nucleic acid molecule which down
CC regulates expression of a neurite growth inhibitor gene (NOGO). The
CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
CC DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule
CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr
CC an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
CC with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA
CC of CD20 in the presence of a divalent cation that is preferably Mg^2^+.
CC Furthermore, it may be contacted with a cell to reduce CD20 activity of
CC the cell and treat a patient having a condition associated with the level
CC of CD20. The treatment may further comprise the use of one or more
CC therapies. In particular, the CD20 targetting nucleic acid may be used to
CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
CC leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
CC immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-
CC targetting nucleic acid is used to cleave RNA of the NOGO gene in the
CC presence of a divalent cation that is preferably Mg^2^+. Furthermore, the
CC nucleic acid may be contacted with a cell to reduce NOGO activity of the
CC cell and treat a patient having a condition associated with the level of
CC NOGO. The treatment may further comprise the use of one or more
CC therapies. In particular, the NOGO-targetting nucleic acid may be used to
CC treat central nervous system (CNS) injury and cerebrovascular accident
CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
CC disease, muscular dystrophy, and/or other neurodegenerative disease
CC states which respond to the modulation of NOGO expression. The present
CC sequence is an inozyme of the invention

XX
CC   The present invention describes a method for detecting the presence of
CC   polymorphisms associated with inflammatory bowel diseases such as
CC   ulcerative colitis and Crohn's disease. The methods can be used to detect
CC   the presence of genetic polymorphisms associated with inflammatory bowel
CC   disease and correlating their occurrence with disease states. They may be
CC   used in this way for phenotypic correlations, forensics, paternity
CC   testing, medicine and genetic analysis. The present sequence is a
CC   polymorphic site described in the exemplification of the invention

PT   New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,
PT   or as specific biomolecule capture probes for surface-enhanced laser
PT   desorption ionization, comprises human myosin-like protein hGDMLP-1.
XX
PS   Disclosure; SEQ ID NO 1347; 214pp; English.
XX
CC   The present invention describes a human genome-derived myosin-like
CC   protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
CC   1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC   nucleic acids can be used as probes to detect, characterise and quantify
CC   hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC   provide initial substrates for the recombinant engineering of hGDMLP-1
CC   protein variants having desired phenotypic improvements, and for
CC   expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC   used as immunogens to raise antibodies that specifically recognise hGDMLP
CC   -1 proteins, as standards in assays used to determine the concentration
CC   and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC   capture probes for surface-enhanced laser desorption ionisation, as
CC   therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC   production, and in vaccines or for replacement therapy. The
CC   polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC   disorder associated with the expression of hGDMLP-1, in particular heart
CC   and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC   The present sequence represents an oligomer used in the screening of the
CC   hGDMLP-1 sequence in the exemplification of the present invention. N.B.
CC   The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO

PT   New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,
PT   or as specific biomolecule capture probes for surface-enhanced laser
PT   desorption ionization, comprises human myosin-like protein hGDMLP-1.
XX
PS   Disclosure; SEQ ID NO 1581; 214pp; English.
XX
CC   The present invention describes a human genome-derived myosin-like
CC   protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
CC   1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC   nucleic acids can be used as probes to detect, characterise and quantify
CC   hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC   provide initial substrates for the recombinant engineering of hGDMLP-1
CC   protein variants having desired phenotypic improvements, and for
CC   expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC   used as immunogens to raise antibodies that specifically recognise hGDMLP
CC   -1 proteins, as standards in assays used to determine the concentration
CC   and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC   capture probes for surface-enhanced laser desorption ionisation, as
```

```
CC   therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC   production, and in vaccines or for replacement therapy. The
CC   polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC   disorder associated with the expression of hGDMLP-1, in particular heart
CC   and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC   The present sequence represents an oligomer used in the screening of the
CC   hGDMLP-1 sequence in the exemplification of the present invention. N.B.
CC   The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO

XX
CC The invention relates to an oligonucleotide for targeted alteration of a
CC genetic sequence, which comprises a single-stranded oligonucleotide
CC having a DNA domain. The DNA domain has at least one mismatch with
CC respect to the genetic sequence to be altered and further comprises
CC chemical modifications of the oligonucleotide. The chemical modifications
CC consist of o-methyl modification, an LNA modification, two or more
CC phosphorothioate linkages on a terminus, or a combination of any two or
CC more of these modifications. The oligonucleotides are useful for
CC directing repair or alteration of plant genetic information. The
CC oligonucleotides are particularly useful for creating plants with desired
CC phenotypes, e.g. environmental or abiotic stress tolerance, improved
CC nutritional value (e.g. altering amino acid content of plants or
CC conferring amino acid over production), herbicide resistance (e.g.
CC glyphosate resistance, imidazolinone and sulphonylurea herbicide
CC resistance, porphyric herbicide resistance or triazine resistance),
CC disease resistance, modified oil production, modified starch production
CC (e.g. increased starch or production of waxy starch), altered floral
CC morphology (e.g. male-sterile plants) or modified fatty acid content
CC (e.g. reduced palmitate, increased stearate or reduced linolenic acid).
CC The oligonucleotides are also useful for producing albino mutants for the
CC analysis of photosynthetic processes. This sequence represents a genome
CC altering oligonucleotide of the invention

PT Novel isolated human testis expressed Patched like protein (HTPL), useful
PT for identifying agonist and antagonist and specific binding partners, and
PT for treating subjects having defects in HTPL.
XX
PS Example 2; Page 217; 718pp; English.
XX
CC The present invention relates to human testis expressed Patched like
CC protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL
CC has two isoforms, with a few single base pair differences between the
CC two. One of the single base pair changes introduces a premature stop
CC codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL
CC shares an overall structure organisation with the Patched protein. The
CC shared structural features strongly imply that HTPL plays a role similar
CC to that of Patched, and is a potential tumour suppressor. HTPL is
CC important in regulating male germ cell development, and the HTPL gene was
CC mapped to human chromosome 10p12.1. HTPL and its coding sequence are
CC useful for diagnosing a disorder caused by mutation in HTPL, and in
CC therapy and manufacture of a medicament for treatment or prevention of
CC such disorder associated with decreased expression or activity of human
CC HTPL. Such disorders include disorders of testis, or adrenal, adult and
CC foetal liver, bone marrow, brain, kidney, lung, placenta, prostate,
CC skeletal muscle or colon function. HTPL proteins and nucleic acids are
CC clinically useful diagnostic markers and potenial therapeutic agents for
CC male infertility and cancer. The present oligonucleotide was used in an
CC example from the invention

XX
CC The present invention relates to human testis expressed Patched like
CC protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL
CC has two isoforms, with a few single base pair differences between the
CC two. One of the single base pair changes introduces a premature stop
CC codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL
CC shares an overall structure organisation with the Patched protein. The
CC shared structural features strongly imply that HTPL plays a role similar
CC to that of Patched, and is a potential tumour suppressor. HTPL is
CC important in regulating male germ cell development, and the HTPL gene was
CC mapped to human chromosome 10p12.1. HTPL and its coding sequence are
CC useful for diagnosing a disorder caused by mutation in HTPL, and in
CC therapy and manufacture of a medicament for treatment or prevention of
CC such disorder associated with decreased expression or activity of human
CC HTPL. Such disorders include disorders of testis, or adrenal, adult and
CC foetal liver, bone marrow, brain, kidney, lung, placenta, prostate,
CC skeletal muscle or colon function. HTPL proteins and nucleic acids are
CC clinically useful diagnostic markers and potenial therapeutic agents for
CC male infertility and cancer. The present oligonucleotide was used in an
CC example from the invention

PT New isolated nucleic acid encoding an isoform of human pregnancy
PT associated plasma protein E, for preventing or aborting pregnancy.
XX
PS Example 2; Page 116; 353pp; English.
XX
CC This invention describes a novel isolated nucleic acid that encodes one
CC of three new isoforms of human pregnancy associated plasma protein E,
CC hPAPP-E. The products of the invention have abortive and contraceptive
CC activity and can be used for gene therapy or in a vaccine. The nucleic
CC acid, polypeptide encoded by it, or antibody to the polypeptide can be
CC used in pharmaceutical compositions or vaccines for preventing or
CC aborting pregnancy. PAPP-E is used in the antenatal diagnosis of
CC dysgenetic pregnancies. The nucleic acids are used as probes to assess
CC the level of PAPP-E isoform mRNA in chorionic villus samples, and the
CC antibodies can be used to assess the expression levels of PAPP-E isoform
CC proteins in chorionic villus samples, to diagnose dysgenetic pregnancies
CC antenatally. This sequence represents an oligomer used in scanning the
CC human PAPP-E genes described in the disclosure of the invention

PT Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of
PT individuals e.g. by determining immunogenetic differences when
PT transplanting between them.
XX
PS Claim 10; Page 302; 345pp; Japanese.
XX
CC The invention relates to a typing kit for judging human leukocyte antigen
CC (HLA) genotype of a sample by hybridising a substrate on which 10-24 base
CC oligonucleotides (ABL30512-ABL31809) originating in the sequences of
CC genes e.g. belonging to HLA class I antigens on human genome and
CC containing gene polymorphisms as alloantigens have been immobilised as
CC primers for amplification of cleaved nucleic acids relating to gene
CC polymorphisms. The method is useful for judging HLA genotypes of
CC individuals by determining immunogenetic differences before transplanting
CC between them, providing genetic information to decide compatibility of
CC organ and tissue for transplantation e.g. of bone marrow, kidney, liver,
CC pancreas, Langerhans islet in pancreas and cornea, susceptibility
CC diagnosis of genetic diseases and identifying individuals

PT New nucleic acid molecule that modulates replication of West Nile Virus
PT (WNV), useful for treating a condition related to WNV infection e.g.
PT pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
XX
PS Claim 23; SEQ ID NO 8990; 495pp; English.
XX
CC The invention relates to nucleic acid molecules that modulate replication
CC of the West Nile Virus (WNV). The nucleic acid molecules are useful for

```
CC   treating a condition related to WNV infection e.g. pancreatitis,
CC   encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
CC   liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
CC   molecule is selected from the group of ribozymes consisting of
CC   Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The
CC   nucleic acid molecules further comprise at least five ribose residues, at
CC   least ten 2'-O-methyl modifications, phosphorothioate linkages on at
CC   least three of the 5' terminal nucleotides and a 3' end modification of a
CC   3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
CC   are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
CC   in the specification. The present sequence is that of a nucleic acid
CC   molecule of the invention

XX
CC The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC given in the specification, a sequence containing at least 15 consecutive
CC nucleotides from the 17 mer sequence, a sequence with, after optimal
CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC hybridizes to them under highly stringent conditions, or the complement
CC of any of them, or the corresponding RNA. The novel isolated nucleic
CC acids of the invention are useful as probes and primers for detecting,
CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC component of a gene chip, in vitro as (anti)sense reagents, and for
CC production of recombinant polypeptides. Any of the nucleic acids,
CC polypeptides, vectors containing the nucleic acids, cells containing the
CC vector or antibodies directed against the polypeptides are useful for
CC preparation of pharmaceuticals for prevention and/or treatment of viral
CC diseases that are characterised by development of tumours or cell
CC degeneration, specifically cancer but also Alzheimer's disease and
CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC patient samples is useful for diagnosis and/or prognosis of these
CC diseases. The polypeptides can also be used to generate antibodies, and
CC both the polypeptide and antibodies are useful as components of protein
CC chips. The nucleic acid sequences of the invention can be used in gene
CC therapy. This polynucleotide sequence represents a tumour suppression
CC related human fukutin oligonucleotide of the invention

PT New isolated nucleic acid, useful for treating viral diseases associated
PT with tumors and cell degeneration, also related polypeptides, antibodies
PT and transfected cells.
XX
PS Disclosure; Page 699; 720pp; French.
XX
CC The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC given in the specification, a sequence containing at least 15 consecutive
CC nucleotides from the 17 mer sequence, a sequence with, after optimal
CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC hybridizes to them under highly stringent conditions, or the complement
CC of any of them, or the corresponding RNA. The novel isolated nucleic
CC acids of the invention are useful as probes and primers for detecting,
CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC component of a gene chip, in vitro as (anti)sense reagents, and for
CC production of recombinant polypeptides. Any of the nucleic acids,
CC polypeptides, vectors containing the nucleic acids, cells containing the
CC vector or antibodies directed against the polypeptides are useful for
CC preparation of pharmaceuticals for prevention and/or treatment of viral
CC diseases that are characterised by development of tumours or cell
CC degeneration, specifically cancer but also Alzheimer's disease and
CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC patient samples is useful for diagnosis and/or prognosis of these
CC diseases. The polypeptides can also be used to generate antibodies, and
CC both the polypeptide and antibodies are useful as components of protein
CC chips. The nucleic acid sequences of the invention can be used in gene
CC therapy. This polynucleotide sequence represents a tumour suppression
CC related human fukutin oligonucleotide of the invention

CC   of viral infections or diseases characterized by development of tumours
CC   or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC   Analysis of the expression of the nucleotides can be used for diagnosis
CC   and/or prognosis of these diseases. The nucleotides and polypeptides can
CC   also be used to screen for their specific interactive molecules,
CC   potentially useful for treating diseases associated with abnormal
CC   expression of the nucleotides.

PT   Inhibiting DNA replication or cell proliferation, useful for treating
PT   tumors, comprises contacting a DNA molecule with a nucleic acid antigene
PT   that specifically hybridizes to a portion of the DNA molecule having dyad
PT   symmetry.
XX
PS   Claim 11; Page 21; 54pp; English.
XX
CC   The invention relates to inhibiting DNA replication and involves
CC   contacting a DNA molecule with a nucleic acid antigene comprising at
CC   least 12 nucleobases selected from natural nucleobases, modified
CC   nucleobases, and their mixture. The antigene specifically hybridizes to a
CC   portion of the DNA molecule having dyad symmetry. The method is useful in
CC   inhibiting DNA replication and, thus, inhibiting the growth of bacteria,
CC   virus (e.g. HIV), fungi, protozoa, helminths and insects. The method is
CC   also useful in inhibiting cell proliferation of tumour cells. The present
CC   sequence represents an antigene inhibiting the inverted repeat (IR)
CC   pairing of adenovirus type 5

CC   The invention comprises the amino acid and coding sequences of the human
CC   NAC-1 protein. The DNA and protein sequences of the invention are useful
CC   for treating or preventing a disorder associated with decreased or
CC   increased expression or activity of human NAC-1. The DNA and protein
CC   sequences are also useful for treating drug addiction and cancer. The
CC   present DNA sequence represents a probe for the human NAC-1 gene.

PT   Novel enzymatic nucleic acid that down-regulates expression of neurite
PT   growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
PT   protein kinase PKR genes, for treating cancer and inflammatory disease.
XX
PS   Claim 59; SEQ ID NO 2386; 317pp; English.
XX
CC   The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC   that down regulate the expression or inhibit the function of a receptor
CC   for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC   IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC   invention are useful for treating: cerebrovascular accident, central
CC   nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC   lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC   restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC   disease, lupus, multiple sclerosis, transplant/graft rejection,
CC   ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC   conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC   nucleic acids of the invention are also useful for down-regulating the
CC   expression of a target gene and as a diagnostic tool to examine genetic
CC   drifts and mutations within diseased cells or to detect the presence of a
CC   target RNA in a cell. The present RNA sequence represents a human IKK-
CC   gamma substrate sequence.

PT   Vector containing nucleic acid associated with breast cancer, useful for
PT   treating, diagnosing and characterizing breast cancer, also related
PT   polypeptides and antibodies.
XX
PS   Claim 1; SEQ ID NO 260; 61pp; English.
XX
CC   The invention relates to a composition which contains at least one vector
CC   (B) containing a nucleic acid (I) associated with breast cancer. The
CC   vector (B), also polypeptides (II) encoded by (I), are used for treatment
CC   of breast cancer. Arrays based on (I), (II), or their fragments, and (II)
CC   -specific antibodies (Ab) are used to predict characteristics (e.g.
CC   invasiveness or stage) of breast cancer, and (I), or its fragments, are
CC   used to modulate characteristics of such cells; to identify breast cancer
CC   genes and to detect breast cancer (by detecting polymorphic nucleic acid
CC   or its products). The present sequence represents a human ER+ breast
CC   cancer differentially expressed sequence.

PT   New isolated transcription units of chromosome 22q11 - used to detect
PT   mutation(s) involved in DiGeorge Syndrome, velo-cardio-facial syndrome
PT   and cleft palate.
XX
PS   Claim 12; Page 23; 37pp; English.
XX
CC   The present sequence is a primer for the PCR amplification of a
CC   transcription unit encoded in the minimal DiGeorge Syndrome (DGS)/Velo-
CC   Cardio-Facial Syndrome (VCFS) chromosomal region (mDGCR) DGS-J
CC   (chromosome 22q11 c2C3). Probes and primer pairs complementary to the
CC   transcription unit can be used to detect and diagnose mutations involved
CC   in DGS, VCFS and cleft palate

PT   HZ-1 virus persistence-associated gene promoter.
XX
PS   Example 1; Fig 3c; 56pp; English.
XX
CC   This sequence represents a direct repeat from the Hz-1 persistence-
CC   associated gene 1 (Hz-1 pag1). The invention relates to the Hz-1 pag1
CC   promoter. The pag1 gene promoter is useful in insect cells for driving
CC   constitutive expression of e.g. genes encoding foreign proteins. The
CC   promoter of the pag1 gene is constitutively expressed and stronger than
CC   that of the polyhedrin gene in insect cells, enabling it to express
CC   foreign genes more strongly e.g. lacZ and luciferase, in addition to
CC   which it can be expressed more prominently as a short promoter. (Updated
CC   on 17-OCT-2003 to standardise OS field)

PT   New PR domain peptides comprising amino acid sequences from, for example
PT   retinoblastoma-interacting zinc finger, or egl-43 proteins, for
PT   regulating gene transcription and controlling cell proliferation and
PT   differentiation.
XX
PS   Disclosure; Col 85-86; 91pp; English.
XX
CC   Retinoblastoma (Rb)-interacting zinc finger (RIZ) protein is a nuclear
CC   phosphoprotein that acts as a cell differentiation factor. RIZ can
CC   modulate cell growth by binding to Rb protein, which is involved in
CC   regulating cell proliferation. In addition, RIZ can act to regulate
CC   transcription. RIZ functions to maintain cells in the G1 phase of the
CC   cell cycle, by interacting with Rb through the cr2 domain of RIZ. RIZ
CC   protein is a PR domain protein and is present primarily in the cell
CC   nucleus. RIZ gene mutations may be implicated in various cancers such as
CC   melanoma, neuroblastoma, leukaemia and breast cancer, and so the RIZ gene
CC   may be used in gene therapy for these disorders. Since RIZ protein is
CC   implicated in cell cycle arrest, inhibition of RIZ activity may be useful
CC   in neurodegenerative disorder therapy e.g. for Parkinson's, Huntingdon's
CC   or Alzheimer's disease, paralysis or motor neurone disorders, or cardiac
CC   disorders e.g. heart disease, where the ability to induce neural/ cardiac
CC   tissue proliferation would be useful. The present sequence is an
CC   oligonucleotide used in the analysis of PR domain peptides of the present
CC   invention

```

```
XX
CC   The present invention describes a method for distinguishing a human
CC   leukocyte antigen (HLA) class I antigen or allele by a combination of
CC   polymerase chain reaction (PCR) using a primer pair whereby all HLA-A, -B
CC   or -C alleles can be amplified or using reverse hybridisation analysis
CC   comprising a DNA probe covalently bonded to microtitre plate wells which
CC   are hybridisable specifically with the base sequence of at least one
CC   specific HLA-A, -B or -C allele. The method is applicable in gene typing,
CC   judging donor-recipient compatibility during organ transplant and
CC   correlation analysis for diagnosis of various diseases. The method is
CC   simple, rapid and accurate, with possibility of mechanisation and
CC   automation, without the problems encountered by using the prior-art
CC   techniques. AAA66943 to AAA67072 represent oligonucleotide probes and PCR
CC   primers for use in the method of the present invention

PT Detecting a target nucleic acid, for identifying microorganisms,
PT diagnosing infections or detecting genetic abnormalities, comprises
PT producing and detecting double-stranded hybrids between probes and the
PT target nucleic acid.
XX
PS Claim 53; Page 25; 128pp; English.
XX
CC The invention relates to detecting a target nucleic acid comprising (a)
CC hybridising a single-stranded or partially single-stranded target nucleic
CC acid to a capture sequence probe and a signal sequence probe to form
CC double-stranded hybrids between the probes and the target nucleic acid,
CC where the capture sequence probe and the signal sequence probe are
CC capable of hybridising to non-overlapping regions within the target
CC nucleic acid and not hybridising to each other, (b) adding a blocker
CC probe to the hybridisation reaction, where the blocker probe hybridises
CC to excess non-hybridised capture sequence probes, (c) binding the hybrid
CC to a solid phase to form a bound hybrid, and (d) detecting the bound
CC hybrid. The method is used to detecting a target nucleic acid. The method
CC is useful for identifying and classifying microorganisms, diagnosing
CC infectious diseases, detecting and characterising genetic abnormalities,
CC identifying genetic changes associated with cancer, studying genetic
CC susceptibility to disease, and measuring response to various types of
CC treatment. The method is also useful for detecting the presence of
CC nucleic acid in test samples. The method is not only rapid and sensitive,
CC but is also highly specific and capable of discriminating highly
CC homologous nucleic acid target sequences. Blocker probes comprising
CC oligonucleotides complementary to the capture sequence probes are used in
CC the method to eliminate excess capture sequence probe, thus reducing the
CC background signal in detection and increasing specificity of the assay.
CC The present sequence is a blocker probe derived from HSV-1, HSV-2, HPV or
CC HBV sequences

PT Use of oxytocin or its analog for treating e.g. osteoporosis.
XX
PS Example 1; Col 15; 17pp; English.
XX
CC The invention relates to treatment of osteoporosis, osteopenia, bone loss
CC or accentuating bone healing involving formulating an oxytocin receptor
CC (OTR) stimulator (preferably oxytocin or its analogue) into a formulation
CC and administering to stimulate osteoblast function, to maintain or
CC increase bone formation and/or inhibit bone resorption. An agent that
CC stimulates endogenous oxytocin release may also be used in the
CC formulation. The invention relates to treating osteoporosis or osteopenia
CC secondary to anorexia nervosa, exercise induced amenorrhoea, Turner
CC Syndrome, cystic fibrosis, diabetes mellitus, hyperthyroidism, Cushing's
CC Syndrome, glucocorticoid excess, acute lymphoblastic leukaemia,
CC Klinefelter's and Kallman's syndromes, alcohol abuse, cigarette smoking,
CC connective tissue disease, osteoarthritis or rheumatoid arthritis; bone
CC loss associated with osteogenesis imperfecta, vitamin D deficiency, bone
CC reconstruction, wound healing or soft skeletal tissue repair and
CC accentuating bone healing. Also for treating bone fractures and for bone
CC remodeling surgery. The present sequence is that of a RT PCR primer used
CC to assess the comparative expression levels of OTR with that of the V1a
CC vasopressin receptor, using the expression of the ribosomal L19 protein
CC as a positive control. OTR mRNA is expressed in undifferentiated
CC osteoblastic cells, differentiated osteoblasts and human osteosarcoma
CC Saos-2 cells

PT Identifying molecules involved in lipid regulation, useful for
PT diagnosing, treating or preventing e.g., arteriosclerosis, comprises
PT identifying a molecule that binds to high bone mass gene or its
PT corresponding wild type gene.
XX
PS Disclosure; Page 41; 409pp; English.
XX
CC The invention relates to a method for identifying a molecule involved in
CC lipid regulation comprising identifying a molecule that binds to or
CC inhibits binding of a molecule to high bone mass (HBM) or its wild type
CC gene, Zmax1. Compounds identified by the method are useful for treating,
CC diagnosing, preventing or screening for normal and abnormal lipid-
CC associated conditions, including arteriosclerosis, cardiovascular
CC disease, stroke, and osteoporosis. The compounds may also be used in the
CC treatment or prevention of diabetic atherosclerosis, neurovascular
CC conditions caused by plaque build-up, poor circulation due to plaque
CC build-up and associated poor wound healing. The methods may be used in
CC gene therapy, pharmaceutical development, and diagnostic assays for bone
CC development disorders. Molecules identified by comparison of Zmax1 and
CC HBM systems can be used as surrogate markers in pharmaceutical
CC development, in diagnosis of human or animal bone disease, and in the
CC treatment of bone diseases. Sequences ABK22776-ABK23411 represent cDNA
CC molecules encoding human Zmax1 and HBM, and PCR primers, probes, linkers
CC and adapters of the invention

PT Identifying target gene of transcription factor for isolation in cells
PT with vectors expressing fused protein of transcription factor with its
PT activator and specific reporter gene, useful in cancer diagnosis and
PT therapy.
XX
PS Example 4; Page 14; 32pp; Japanese.
XX
CC The invention relates to a method of detecting the target gene of a
CC specific transcription factor. The method involves (a) supplying cells
CC containing a vector expressing a fused protein of the transcription
CC factor with an activator of this transcription factor and another vector
CC containing a reporter gene; (b) separating cells; and (c) comparing the
CC gene expression dose of the cells. The method is for identifying a target
CC gene of transcription factor for isolation, which is used for application
CC in cancer diagnosis and drug development for e.g. Li-Fraumeni syndrome
CC and long-term memory loss. With expression of the reporter gene as
CC indication, the identification and isolation can be efficiently carried
CC out because its enlarged expression dose in a cell is induced by the
CC transcription factor. Sequences ABL40867-874 represents primers used in
CC the course of the invention

PT   Novel nucleic acid molecule comprises the code for a conserved domain of
PT   retinoblastoma protein-interacting zinc finger protein, positive
PT   regulatory domain I-binding factor involved in regulating gene
PT   transcription.
XX
PS   Example 4; Col 36; 93pp; English.
XX
CC   The invention relates to a nucleic acid molecule encoding a PR domain
CC   peptide present in human and rat retinoblastoma protein-interacting zinc
CC   finger protein (RIZ), PRDI-BF1 (human positive regulatory domain I-
CC   binding factor 1), EVI-1 (human ecotropic viral integration site-1
CC   myeloid transforming gene product) or Caenorhabditis elegans egl-43 gene
CC   product. The DNA of the invention is involved in regulating transcription
CC   of a target gene. RIZ acts as a cell-differentiation factor and modulates
CC   a function of a cell by binding to retinoblastoma (Rb) protein, which is
CC   involved in regulating cell proliferation in various human diseases or
CC   conditions, e.g. cancer. RIZ regulates the growth of normal adult cardiac
CC   muscle cells and prevents proliferation of surviving cells following
CC   cardiac muscle cell death. RIZ is expressed in neural cells. This is
CC   useful for healing after injury of neural tissue and for treating
CC   neurodegenerative diseases such as Parkinson's, Huntington's or
CC   Alzheimer's disease and paralysis, or motor neuron disorders through
CC   induced or decreased proliferation of neural cells. The PR domain or RIZ
CC   active fragment containing a PR domain is useful as a probe to identify
CC   transcription factors or oncogenic proteins in a cell that bind the PR
CC   domain. Sequences ABK17334-ABK17353 represent DNA molecules and primers

PT   Determining methylation status of CpG dinucleotides using modified
PT   genomic sequences, oligonucleotides and/or PNA-oligomers, useful in the
PT   characterization, grading, staging and/or diagnosis of colon cancer.
XX
PS   Claim 26; Page 158; 219pp; English.
XX
CC   The present invention describes a method for determining the methylation
CC   status of CpG dinucleotides within the genes for oestrogen receptor, p21,
CC   p27, p16, progesterone receptor, myoglobin, pcna, cdc2, c-erB2, p53
CC   and/or CEA, which comprises contacting the target nucleic acid with a
CC   reagent that distinguishes between methylated and non-methylated CpG
CC   dinucleotides, and determining from the methylation status of the CpG
CC   positions the presence of a colon cancer. A set of oligomers or peptide
CC   nucleic acid (PNA)-oligomers can be used as probes for determining the
CC   cytosine methylation state and/or single nucleotide polymorphisms (SNP)
CC   of a corresponding genomic DNA by analysis of a chemically pretreated
CC   genomic DNA. The pretreated genomic DNA is useful for the determination
CC   of the methylation status of a corresponding genomic DNA and/or detection
CC   of SNPs. The methods and pretreated genomic DNA are also useful for the
CC   characterisation, classification, diagnosis and differentiation of colon
CC   cell proliferative disorders. ACF62752 to ACF63278 represent sequences

CC dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118
CC represent specifically claimed nucleotide sequences from the present
CC invention. Oligonucleotides from the present invention can be used: for
CC differentiating between healthy haematopoietic cells and proliferative
CC disorder haematopoietic cells; for differentiating between acute
CC lymphocytic leukaemia and acute myelogenous leukaemia; as probes for
CC determining the cytosine methylation state and/or single nucleotide
CC polymorphisms (SNPs) of haematopoietic cell proliferation disorder
CC related sequences and their complements; and as primers for the
CC amplification of haematopoietic cell proliferation disorder related DNA
CC sequences. The nucleotide sequences from the present invention can also
CC be used for detecting a predisposition to, differentiation between
CC subclasses, diagnosis, prognosis, treatment and/or monitoring of
CC haematopoietic cell proliferative disorders. The present method enables a
CC highly specific classification of haematopoietic cell proliferative
CC disorders allowing for improved and informed treatment of patients

PT New transgenic animals (e.g. mice), useful as models for studying bone
PT density modulation, developing drugs for treating or preventing bone
PT diseases (e.g. osteoporosis), or diagnosing diseases characterized by
PT reduced bone density.
XX
PS Disclosure; Page 57; 603pp; English.
XX
CC The invention relates to novel transgenic animals expressing the high
CC bone mass (HBM) gene, expressing the corresponding wild type HBM gene,
CC comprising an alteration of the gene encoding LRP5 or LRP6, or expressing
CC an LRP5 that is modulated by an altered gene control sequence introduced
CC by homologous or non-homologous recombination. The transgenic animals are
CC for the study of bone density modulation or bone mass modulation. The
CC invention has osteopathic and cytostatic activity. The polynucleotides of
CC the invention may have a use in gene therapy. The transgenic animals and
CC nucleic acids are for the study of bone density modulation, where the
CC bone mass is modulated relative to non-transgenic animals of the same
CC species in more than one parameter selected from bone density, bone
CC strength, trabecular number, bone size, or bone tissue connectivity. The
CC transgenic animals, nucleic acids and methods are useful for identifying
CC molecules involved in bone development, and for developing pharmaceutical
CC compositions, which may be employed for treating or preventing bone
CC diseases, e.g. osteoporosis, osteomalacia, rickets, Paget's disease, or
CC neoplasms of the bone. The transgenic animals and nucleic acids are also
CC useful in methods for diagnosing diseases involved in bone development,
CC or characterised by reduced bone density or mass. The present sequence is
CC used in the exemplification of the invention

XX
PT   New nucleic acid comprising a mutation in LRP5 or LRP6, useful for
PT   diagnosing a HBM-like phenotype in a subject and for preparing a
PT   composition for modulating bone mass and/or lipid levels in a subject
PT   suffering from e.g. osteoporosis.
XX
PS   Example 2; Page 63; 629pp; English.
XX
CC   The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) and
CC   LRP6 mutants, which results in a HBM-like phenotype when expressed in a
CC   cell. The HBM-like phenotype results in bone mass modulation and/or lipid
CC   level modulation. The invention is useful for diagnosing a HBM-like
CC   phenotype in a subject and for preparing a composition for modulating
CC   bone mass and/or lipid levels in a subject suffering from e.g.
CC   osteoporosis. The present sequence is a Sequence Tagged Site (STS)
CC   marker, which was used to prepare a physical map of the Zmax1 (LRP5) gene
CC   region.

XX
CC   This invention relates to a novel method for detecting and
CC   differentiating between lung cell proliferative disorders associated with
CC   at least one gene and/or their regulatory regions. Specifically, it
CC   refers to a method comprising contacting a target nucleic acid in a
CC   biological sample with at least one reagent, wherein the reagent is able
CC   to distinguish between methylated and non-methylated CpG dinucleotides
CC   present in the target DNA. As such, it is possible to further
CC   differentiate and diagnose medical conditions including adenocarcinoma
CC   and squamous cell carcinoma, and their respective adjacent lung tissue.
CC   The present invention describes cytostatic oligomers and PNA-oligomers
CC   that are useful as probes for determining the cytosine methylation state
CC   or single nucleotide polymorphisms (SNPs) of the target sequence. This
CC   oligonucleotide sequence is a primer oligomer used for the analysis of
CC   CpG positions within genomic DNA, used in an exemplification of the
CC   invention.

PT   New nucleic acid molecule comprising a sequence of an allele of a
PT   polymorphic bovine acyl CoA-diacylglycerol transferase gene useful for
PT   testing a mammal for its predisposition for fat content of milk and for
PT   meat marbling.
XX
PS   Example 1; Page 36; 91pp; English.
XX
CC   The present invention describes a nucleic acid molecule (NA) (I) encoding
CC   a bovine acyl CoA-diacylglycerol transferase (DGAT) contributing to or
CC   indicative for low fat content of milk and to low meat marbling
CC   (intramuscular fat content). Human DGAT is located to chromosome 8, and
CC   bovine DGAT is located to chromosome 14. (I) is useful for testing a
CC   mammal for its predisposition for fat content of milk and/or its
CC   predisposition for meat marbling. The method comprises analysing the gene
CC   encoding DGAT for nucleotide polymorphisms (e.g. single nucleotide
CC   polymorphisms (SNPs)) which are connected with the predisposition. The
CC   nucleotide polymorphisms are located in the coding region of the DGAT
CC   gene and result in substitution, deletion and/or addition of an amino
CC   acid sequence of the polypeptide which is encoded by the gene. The
CC   nucleic acid molecule has at the position 10433 and 10434 of the DGAT
CC   gene a guanine and a cytosine residue, at position 3343 a cytosine or
CC   guanine, 11030 a guanine, 11048 a cytosine or thymine and 11093 a
CC   thymine, which correlate with a predisposition for low fat content of
CC   milk and low meat marbling. The nucleic acid molecule has at the position
CC   corresponding to position 10433 and 10434 of the DGAT gene two adenine
CC   residues which correlate with a predisposition for high content of milk
CC   and high meat marbling. The nucleotide polymorphisms are located in a
CC   region which is responsible for the regulation of the expression of the
CC   product of the gene encoding DGAT. ABZ76924 to ABZ77045 and ABP96035 to

PT   Diagnosing, preventing and treating non-small cell lung cancer (NSCLC)
PT   comprises determining an expression level of an NSCLC-associated gene in
PT   a sample.
XX
PS   Disclosure; SEQ ID NO 519; 394pp; English.
XX
CC   The invention relates to a method of diagnosing non-small cell lung
CC   cancer (NSCLC) or a predisposition to developing NSCLC in a subject by
CC   determining the expression level of a NSCLC-associated gene in a
CC   biological sample derived from the subject, where an increase or decrease
CC   of the level compared to a normal control level of the gene indicates
CC   that the subject suffers from or is at risk of developing NSCLC. The
CC   method is useful in diagnosing NSCLC or a predisposition to developing
CC   NSCLC in a subject. The compound, polynucleotide and the encoded
CC   polypeptide and composition are useful in treating or preventing NSCLC.
CC   This sequence corresponds to an antisense oligonucleotide of genes that
CC   are differentially expressed in NSCLC cells.

PT Treatment of airway diseases such as asthma - by topically applying
PT adenosine-free antisense oligo:nucleotide to airway epithelium of
PT subject.
XX
PS Claim 5; Page 28; 71pp; English.
XX
CC A method for treating airway disease in a subject has been produced,
CC which involves the topical administration of an essentially adenosine
CC free antisense oligonucleotide (ON) to the airway epithelium of the
CC subject. The present sequence is an antisense oligonucleotide HSVCAM1AS1
CC specific for the human vascular cell adhesion molecule-1 (VCAM-1). The
CC method can be used to treat airway diseases such as cystic fibrosis,
CC asthma, chronic obstructive pulmonary disease, bronchitis and other
CC airway diseases characterised by an inflammatory response. By eliminating
CC adenosine from the antisense ON, its liberation upon antisense
CC degradation is prevented, thereby preventing adenosine- induced
CC bronchoconstriction in patients with hyper-reactive airways

PT New isolated nucleic acid segments from the human genome - used for
PT determining polymorphic forms for use in e.g. forensics, paternity
PT testing or phenotypic typing for disease.
XX
PS Claim 16; Page 65; 310pp; English.
XX
CC AAX09121-X10268 are allele-specific oligonucleotide primers used in the
CC isolation of various biallelic polymorphic markers found in the human
CC genome (represented in AAX10269-X12937). These primers can be used in a
CC method for determining polymorphic forms in an individual for use in e.g.
CC forensics, paternity testing or for phenotypic typing for diseases such
CC as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial
CC hypercholesterolemia, polycystic kidney disease, hereditary
CC spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary
CC haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos
CC syndrome, osteogenesis imperfecta, acute intermittent porphyria,
CC autoimmune diseases, inflammation, cancer, diseases of the nervous
CC system, infection by pathogenic microorganisms, and characteristics such
CC as longevity, appearance (e.g. baldness, obesity), strength, speed,
CC endurance, fertility, and susceptibility or receptivity to particular
CC drugs or therapeutic treatments. The isolated polymorphic nucleic acid
CC segments can also be used to produce medicaments for the treatment or
CC prophylaxis of such diseases

```
PT   New isolated Toxoplasma gondii nucleic acids used, e.g. to treat
PT   infection caused by this microorganism.
XX
PS   Example 12; Page 361; 381pp; English.
XX
CC   The invention provides isolated Toxoplasma gondii nucleic acids that
CC   encode immunogenic polypeptides. The T. gondii nucleic acid molecules,
CC   immunogenic proteins and antibodies to the proteins can be used to
CC   inhibit T. gondii oocyst shedding in a cat due to infection with T.
CC   gondii. They can be used for preventing T. gondii infection and for
CC   preventing the spread of T. gondii infection. They can also be used for
CC   detecting T. gondii infection. The detection method can be used to detect
CC   parasite cysts or oocysts in feces, e.g. from enteric apicomplexa oocysts
CC   such as Cryptosporidium oocysts and Toxoplasma oocysts. The present
CC   sequence represents a primer used in PCR amplification of a DNA encoding
CC   immunogenic T. gondii protein

PT   New antisense oligonucleotides used in treatment of, e.g. pulmonary
PT   vasoconstriction.
XX
PS   Disclosure; Page 47; 120pp; English.
XX
CC   The specification describes antisense oligonucleotides (AAX52869-X55271)
CC   directed against at least 2 mRNAs selected from target genes, coding and
CC   non-coding regions of RNAs corresponding to target genes, gene initiation
CC   codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
CC   -end and the juxta-section between coding and non-coding regions and all
CC   segments of RNAs encoding proteins associated with one or more diseases,
CC   conditions or mixtures. The antisense oligonucleotides may be derived
CC   from sequences AAX55272-74. These multiple target oligonucleotides
CC   (specifically AAX55180-271) can be used for the antisense treatment of
CC   diseases and conditions. Typical diseases and conditions are those
CC   associated with impaired respiration and inflammation, including lung
CC   diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC   acute asthma, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC   pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC   disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
CC   colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC   hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC   well as all types of cancers which may metastasize or have metastasized
CC   to the lungs, including breast and prostate cancer

PT   Nucleic acid encoding splice variants of transporter associated with
PT   antigen processing proteins, useful for improving the immune responses.
XX
PS   Example 1; Page 59; 77pp; English.
XX
CC   This oligonucleotide is based on exon 10 of the human TAP2 (transporter
CC   associated with antigen processing 2) gene. It was used to screen a human
CC   splenic cDNA library. cDNA (see AAZ34527) encoding a novel TAP2 splice
CC   variant, TAP2iso (see AAY32133), was isolated. The oligonucleotide was
CC   also used as a 5' primer in the RT-PCR amplification of RNA from various
CC   human cell lines in order to determine the expression pattern of TAP2iso.
CC   The discovery of splice variant TAP subunits alters the prior theory of
```

CC immune response and introduces a cellular mechanism for diversification
CC of antigen display to the CD8-positive T cells of the immune system.
CC Methods for diagnosis and treatment of diseases or conditions associated
CC with abnormal TAP isoform expression, or of expanding the repertoire of
CC antigen peptides to which an individual's immune system is capable of
CC responding, are also disclosed

PT bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT cancers.
XX
PS Claim 18; Page 400; 1343pp; English.
XX
CC The present invention describes a new composition comprising an antisense
CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC nucleic acids involved in bronchoconstriction, allergies, and/or
CC inflammation. The ON can have antiinflammatory, antiallergic,
CC antiasthmatic, cytostatic and analgesic activities. The compositions are
CC useful for the treatment of diseases associated with inflammation,
CC impaired airways, including lung disease and diseases whose secondary
CC effects afflict the lungs of a subject. They can be used for treating
CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC impeded respiration, respiratory distress syndrome, pain, cystic
CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC carcinomas, and cancers which may metastasise to the lungs, including
CC breast and prostate cancer. The reduction of the adenosine content of the
CC ONs reduces side effects. The A-containing ONs break down with the
CC release of deoxyadenosine which activates adenosine receptors causing
CC bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC nucleotide sequences given in the sequence listing from the present
CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC AAA33992) are specifically claimed ONs from the present invention. N.B.
CC Sequences given in the disclosure of the present invention do not match
CC up with their corresponding SEQ ID NO: sequences given in the sequence
CC listing

PT adenosine receptors during metabolism, useful e.g. for treating cancers
PT and respiratory obstructions.
XX
PS Claim 14; Page 145; 1592pp; English.
XX
CC The present invention describes low adenosine (A) content antisense
CC oligonucleotides and compositions (I) comprising them. In the antisense
CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC The antisense oligonucleotides and (I) can be used to down-regulate the
CC expression and or activity of target polypeptides associated with
CC lung/respiratory disorders and malignancies, such as stimulating and
CC activating peptide factors and transmitters, transcription factors,
CC immunoglobulins and antibodies, antibody receptors, cytokines and
CC chemokines, endogenously produced specific and non-specific enzymes,
CC binding proteins, adhesion molecules and their receptors, cytokine and
CC chemokine receptors, adenosine receptors, bradykinin receptors, central
CC nervous system (CNS) and peripheral nervous and non-nervous system
CC receptors, CNS and peripheral nervous and non-nervous system peptide
CC transmitters, defensins, growth factors, vasoactive peptides and
CC receptors, binding proteins and malignancy associated proteins. The
CC antisense oligonucleotides may be used in this way to treat disorders
CC including respiratory obstruction (especially pulmonary obstruction
CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
CC surfactant hypoproduction which are associated with a disease or
CC condition selected from pulmonary vasoconstriction, inflammation,
CC allergies, asthma, impeded respiration, respiratory distress syndrome
CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
CC pulmonary transplantation rejection, pulmonary infections, bronchitis,
CC and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
CC fragments and antisense oligonucleotides used in the exemplification of
CC the present invention

PT   New endoplasmic reticulum stress transcription factor (known as bZIP) for
PT   controlling expression of endoplasmic reticulum chaperone, useful for
PT   treating cancers, arteriosclerosis, cystic fibrosis, ischemic diseases,
PT   wounds and ulcers.
XX
PS   Example 1; Fig 5; 157pp; English.
XX
CC   An endoplasmic reticulum stress transcription factor (bZIP) capable of
CC   regulating transcription inducing activity exhibited by an element (ERSE)
CC   can be used in a method for controlling expression of an endoplasmic
CC   reticulum chaperone. The method comprises expressing bZIP. The method can
CC   be used for expression of a foreign protein by positively regulating
CC   expression of an endoplasmic reticulum chaperone gene. bZIP is useful for
CC   controlling the expression of endoplasmic reticulum chaperone either
CC   positively or negatively in cells and therefore is useful for treatment
CC   or prophylaxis of cancers, arteriosclerosis, cystic fibrosis, ischaemic
CC   diseases, wounds and ulcers. bZIP also maintains the correct conformation
CC   of the endoplasmic reticulum chaperone and thereby increases the
CC   expression of a foreign protein. This sequence taken from the
CC   calreticulin (CRT) promoter contains an ERSE like sequence

PT   Detecting parasite oocysts or cysts in feces, comprises eluting DNA from
PT   sample into aqueous solution by heating, amplifying DNA with primers
PT   specific for oocysts or cysts being detected, and detecting amplification
PT   product.
XX
PS   Example 12; Page 39; 188pp; English.
XX
CC   The invention relates to detection of parasite oocysts or cysts in a
CC   faeces sample comprising contacting the sample with a solid support,
CC   drying and then washing the sample with an aqueous wash solution, adding
CC   an aqueous elution solution and eluting DNA from the sample by heating
CC   and amplifying by PCR oocyst/cyst-specific DNA and detecting the
CC   amplification products. The method is useful for detecting parasite
CC   oocysts e.g., enteric apicomplexa oocysts such as Cryptosporidium oocysts
CC   or Toxoplasma oocysts, or for detecting parasite cysts e.g. Giardia
CC   cysts. The method is also useful for developing vaccines to prevent
CC   oocyte shedding in cats. The present sequence is a PCR primer used to
CC   isolate DNAs encoding immunogenic proteins from Toxoplasma gondii

PT   Novel polypeptide vaccine produced in plants, useful for inducing an
PT   immune response to a self-antigen on the surface of certain tumor cells.
XX
PS   Disclosure; Page 30; 89pp; English.
XX
CC   The invention relates to a novel polypeptide self-antigen (I) useful as a
CC   tumour-specific vaccine in a subject with a tumour or at risk of
CC   developing a tumour. (I) includes an epitope or epitopes unique to, or
CC   over expressed by, cells of the tumour, thereby distinguishing the tumour
CC   from all other tumours of the same or different histological type, or in
CC   the subject or in another member of the subject's species. (I) is
CC   epitopes in their native form. (I) is capable of inducing an immune
CC   response in a mammal, when used as an individual-specific immunogenic
CC   product comprising (I); and as a vaccine composition useful for inducing
CC   a tumour-specific immune response, idiotype-specific anti-lymphoma immune
CC   response, a polyclonal immune response to at least one idiotype of a
CC   surface immunoglobulin or a polyclonal immune response to an idiotype.
CC   The vaccine composition is useful for inducing a tumour-specific immune
CC   antibody response in a tumour-bearing subject or a subject who had a
CC   tumour e.g. B-cell lymphoma, and was treated so that no tumour is
CC   clinically or radiographically evident. (I) is useful for inducing a
CC   protective antitumour immune response. (I) can be produced at high
CC   levels, is easy to purify and can be appropriately folded to mimic the
CC   conformation of the native epitopes displayed at the tumour cell surface.
CC   AAS45529-AAS45579 represent B cell lymphoma self antigen vaccine linker
CC   sequences and PCR primers of the invention

PT   Analyzing target nucleic acid sequences, useful for population genetics,
PT   drug development and diagnosing cancer, comprises hybridizing triple
PT   forming oligonucleotide and probe to target sequence.
XX
PS   Example 1; Page 64; 141pp; English.
XX
CC   The sequence is the polypyrimidine region of a reverse phase triplex
CC   forming oligonucleotide, RP-TFO used to analyse SNP DYS271 using the
CC   method of the invention. The invention relates to analysing target
CC   nucleic acid sequences comprising restricting isolated DNA, hybridising
CC   at least one triplex forming oligonucleotide (TFO), adding a 3' to 5'
CC   exonuclease to form a protected nucleic acid sequence (PNAS) tail
CC   structure, hybridising the captured structure with a single nucleotide
CC   polymorphisms (SNP) identification probe and determining the SNP score.
CC   The methods can be used for analysing target nucleic acid sequences,
CC   especially genomic DNA sequences, to determine if they contain SNPs or
CC   short tandem repeats (STRs). The methods can be used to detect SNPs for
CC   use in population genetics, drug development, forensics, cancer, genetic
CC   disease research, genomic analysis, diagnostics and therapeutics in
CC   humans, plants and animals

PT Treating proliferative skin or eye diseases and scarring, using ribozymes
PT that cleave RNA encoding cytokines involved in inflammation, matrix
PT metalloproteinases, growth factors and cell-cycle dependent kinases.
XX
PS Example 1; Page 185; 408pp; English.
XX
CC The present invention describes a method for treating a proliferative
CC skin or eye disease and scarring. The method involves administering a
CC ribozyme (I) which cleaves RNA encoding a cytokine involved in
CC inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
CC dependent kinase, growth factor or a reductase, or administering a
CC nucleic acid molecule (II) comprising a promoter operably linked to a
CC nucleic acid segment encoding (I). (I) can have antipsoriatic,
CC dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,
CC ophthalmological, vulnerary, keratolytic and virucide activities, and
CC cleaves RNA encoding cytokine involved in inflammation. (I) can be used
CC in gene therapy. (I) and (II) are useful for treating proliferative skin
CC diseases such as psoriasis, atopic dermatitis, actinic keratosis,
CC squamous or basal cell carcinoma and viral or seborrheic wart. They can
CC also be used for treating proliferative eye diseases such as diabetic
CC retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
CC prematurity and retinal detachment, and for treating and preventing
CC scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
CC scar. AAH57577 to AAH62099 represent sequences used in the

PT Arraying genome clones.
XX
PS Claim 4; Page 7; 528pp; Japanese.
XX
CC The present invention describes a method of arraying genome clones. The
CC method comprises: (a) clones of the genomic libraries contained in
CC multiwell plates numbered for discrimination are mixed in each of the
CC multiwell plates; (b) a primer designed based on the chromosome marker
CC sequence is added to the mixture to carry out an amplification reaction;
CC (c) a signal corresponding to the marker is detected from the resultant
CC amplified product to specify the discrimination Nos. of the multiwell
CC plates containing the clones having said marker sequence; (d) the order
CC of the markers is changed so that the same discrimination Nos. succeed to
CC the maximum in the specified discrimination Nos. to array the multiwell
CC plates; (e) the clones in the multiwell plates of the specified
CC discrimination Nos. are mixed respectively in each wells of longitudinal
CC and lateral directions; (f) the mixed clones are cultured and the
CC resultant cultures are amplified by using the above primer; (g) signals
CC are detected from the amplified products; (h) the clones in the multiwell
CC plates are specified from the detected result; and (i) the clones are
CC reconstituted as the positions on the chromosome and arrayed. The
CC microarray is useful for gene analysis. ABL42957 to ABL45322 represent
CC PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634
CC represent PCR primers for human chromosome 21q22.1, which are

PT   Detecting Staphylococcus by nucleic acid amplification, useful for
PT   testing e.g. clinical samples, can identify simultaneously enterotoxin
PT   and methicillin-resistance genes.
XX
PS   Claim 6; Fig 2; 26pp; German.
XX
CC   The invention relates to a method for detecting Staphylococcus DNA in a
CC   sample by nucleic acid amplification using various primers (ABL58823-
CC   ABL58848) or their variants. The method is used to detect staphylococci
CC   that produce enterotoxins and/or are resistant to antibiotics
CC   (methicillin), e.g. in blood or tissue samples, foods, water and
CC   bacterial cultures. The method allows simultaneous determination of many
CC   genes since the specified primers are functional under the same
CC   conditions and it eliminates the need for a lengthy culture stage

PT   Use of a polypeptide self-antigen as a tumor-specific vaccine.
XX
PS   Disclosure; Page 12; 47pp; English.
XX
CC   The invention relates to a polypeptide self-antigen useful as a tumour-
CC   specific vaccine in a subject with a tumour or at risk of developing a
CC   tumour and is encoded at least in part by a nucleic acid in the cells of
CC   the tumour. The polypeptide self antigen is useful for treating or
CC   preventing tumour. The present sequence represents a tumour
CC   immunoglobulin V, IgV, PCR primer

XX
CC   The invention describes a new polynucleotide comprises a polynucleotide:
CC   (a) having any of 101 nucleic acid sequences with 18-19 bp fully defined
CC   in the specification; (b) encoding any of seven polypeptides having 7
CC   amino acids, or a polypeptide with 3 amino acids; (c) capable of
CC   hybridising to a Cytochrome P450 polypeptide 2C8 (CYP2C8) gene; (d)
CC   encoding a molecular CYP2C8 variant polypeptide or its fragment. The
CC   polynucleotide, gene, vector, polypeptide or antibody is useful for
CC   diagnosing or treating a disease, for preparing a diagnostic composition
CC   for diagnosing a disease, or for preparing a pharmaceutical composition
CC   for treating a disease. This disease includes arachidonic acid
CC   metabolism, cancer or cardiovascular diseases. This sequence represents a
CC   primer used to isolate regions of the human cytochrome P450 polypetide
CC   2C8 gene (CYP2C8) in order to identify the single nucleotide polymorphism
CC   (SNP) in that region of different individuals useful in disease diagnosis

PT Novel polypeptide antigen which includes epitope overexpressed by tumor
PT cells e.g. B-cell lymphoma, and is capable of inducing immune response in
PT mammal without need for adjuvant, useful as anti-tumor vaccine component.
XX
PS Example 2; Page 11; 48pp; English.
XX
CC The invention describes a polypeptide self-antigen (I) useful as tumour-
CC specific vaccine in subject with a tumour, including an epitope or
CC epitope unique to, or overexpressed by, cells of the tumour, is produced
CC in a cell or organism that has been transformed or transfected with the
CC nucleic acid derived from the tumour of subject, and is capable of
CC inducing an immune response in a mammal without a need for adjuvant or
CC other immunostimulatory materials. (I) is useful for inducing an immune
CC response, preferably a protective anti-tumour immune response in a
CC mammal, preferably human. A vaccine composition comprising (I) is useful
CC for inducing a tumour-specific immune antibody response in a tumour-
CC bearing subject (preferably human) or a subject who had a tumour and was
CC treated so that no tumour is clinically radiographically evident. The
CC vaccines are preferably useful for inducing immune antibody response
CC against B-cell lymphoma. The polypeptide is produced without the need for
CC denaturation or renaturation. (I) is rapidly produced in plants by
CC transient viral expression. Plant samples expressing the desired protein
CC can be positively identified by both enzyme linked immunosorbent assay
CC (ELISA) and Western blotting 4 weeks after molecular cloning. Thus, (I)
CC is expressed rapidly and easily in plants. This sequence represents a
CC primer used to isolate B-cell lymphona associated variable region gene
CC fragments for use in creation of the self-antigen

PT Novel isolated nucleic acid molecule comprising single nucleotide
PT polymorphism associated with fish, useful for forming PCR primers which
PT are used for detecting single nucleotide polymorphisms in fish nucleic
PT acids.
XX
PS Claim 18; SEQ ID NO 715; 233pp; English.
XX
CC The present invention describes an isolated nucleic acid (I) comprising a
CC single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid of
CC Salmo salar SNPs, Oreochromis niloticus SNPs or Atlantic halibut SNPs;
CC and (ii) a nucleic acid having nucleotide sequence that hybridises to
CC (i), or its complement under highly stringent hybridisation conditions.
CC Also described: (1) an isolated oligonucleotide (II) comprising at least
CC 17 contiguous nucleotides of a nucleotide sequence of S. salar SNPs, O.
CC niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod
CC polymorphic sites and seabass polymorphic sites, or their complement; (2)
CC a primer pair (III) suitable for use in PCR, comprising two (II) capable
CC of amplifying a nucleotide sequence chosen from S. salar SNPs and, O.
CC niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod
CC polymorphic sites and seabass polymorphic sites; and determining (M1) the
CC origin of fish sample comprising providing a parentage genotype database
CC comprising a collection of candidate parent genotypes, where each of the
CC candidate parent genotype represents a distinct origin, and comparing a
CC sample genotype to the parentage genotype database, where a match between
CC the sample genotype and one of the candidate parent genotype identifies
CC to the origin of the sample. (M1) is useful for determining the origin of
CC a fish sample such as family salmonidae, S. salar, Tilapia, O. niloticus,
CC rainbow trout, halibut, seabass and Atlantic cod. (II) is useful for
CC detecting nucleic acid molecule comprising SNP in a sample, which
CC involves contacting the sample containing nucleic acids with one or more
CC (II) derived from nucleotide sequence of S. salar SNPs and O. niloticus
CC SNPs, and identifying nucleic acid that hybridises to (II). (II) is
CC useful for detecting nucleic acid molecule comprising a polymorphic
CC sequence in a sample, comprising contacting the sample containing nucleic
CC acids with one or more (II) which is derived from O. niloticus
CC microsatellite, O. niloticus SNPs, Atlantic halibut SNPs, cod polymorphic
CC sites or seabass polymorphic sites, and identifying a nucleic acid that
CC hybridises to (II). (III) is useful for detecting nucleic acid molecule
CC comprising a microsatellite sequence in sample. The present sequence is
CC used in the exemplification of the present invention.

PT New double-stranded interfering nucleic acid, useful e.g. for treatment
PT and diagnosis of cancer, downregulates the vascular endothelial growth
PT factor receptor gene.
XX
PS Example 3; SEQ ID NO 697; 207pp; English.
XX
CC The present invention describes a double-stranded short interfering
CC nucleic acid (siNA) that downregulates expression of the vascular
CC endothelial growth factor receptor (VEGFR) gene. Also described: (1) a
CC siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo
CC delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors
CC that express siNA; and (5) single-stranded siNA with similar properties.
CC The siNAs have antiangiogenic, cytostatic, antidiabetic,
CC ophthalmological, antiarthritic, antipsoriatic, nephrotropic and
CC gynaecological activities. The siNA are useful for modulating
CC (downregulating) the expression of VEGFR genes. The siNA are potentially
CC useful for treating a wide range of angiogenesis-associated conditions,
CC particularly cancers, diabetic retinopathy, macular degeneration,
CC neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma,
CC and polycystic kidney disease. The siNA may also be useful for diagnosis,
CC drug screening, target identification and validation, genetic
CC engineering, studying gene function, and also for gene mapping (e.g. of
CC single-nucleotide polymorphisms). The present sequence is used in the
CC exemplification of the present invention.

PT   New double-stranded interfering nucleic acid, useful e.g. for treatment
PT   and diagnosis of cancer, downregulates the vascular endothelial growth
PT   factor receptor gene.
XX
PS   Example 3; SEQ ID NO 270; 207pp; English.
XX
CC   The present invention describes a double-stranded short interfering
CC   nucleic acid (siNA) that downregulates expression of the vascular
CC   endothelial growth factor receptor (VEGFR) gene. Also described: (1) a
CC   siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo
CC   delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors
CC   that express siNA; and (5) single-stranded siNA with similar properties.
CC   The siNAs have antiangiogenic, cytostatic, antidiabetic,
CC   ophthalmological, antiarthritic, antipsoriatic, nephrotropic and
CC   gynaecological activities. The siNA are useful for modulating
CC   (downregulating) the expression of VEGFR genes. The siNA are potentially
CC   useful for treating a wide range of angiogenesis-associated conditions,
CC   particularly cancers, diabetic retinopathy, macular degeneration,
CC   neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma,
CC   and polycystic kidney disease. The siNA may also be useful for diagnosis,
CC   drug screening, target identification and validation, genetic
CC   engineering, studying gene function, and also for gene mapping (e.g. of
CC   single-nucleotide polymorphisms). The present sequence is used in the
CC   exemplification of the present invention.

PT   primers for polymerase chain reaction-based diagnostic assays.
XX
PS   Claim 3; SEQ ID NO 26; 41pp; English.
XX
CC   The present invention describes a method for detecting wheat and barley
CC   fungal pathogens which are resistant to certain fungicides. The wheat and
CC   barley fungi are Tapesia yallundae and Tapesia acuformis, which cause
CC   eyespot disease. The present invention describes nucleic acid molecules,
CC   a kit and a method which are useful for detecting the fungal pathogen,
CC   and can be used for monitoring disease development in plant populations.
CC   The present sequence is used in the exemplification of the present
CC   invention.

CC   The invention relates to short interfering nucleic acids (siNA) which
CC   downregulate expression of HIV gene by RNA interference. The siNAs may or
CC   may not comprise ribonucleotides and may be double or single stranded.
CC   They further comprise sense and antisense regions, or alternatively are
CC   assembled from a sense oligonucleotide and an antisense oligonucleotide.
CC   Specifically, the siNAs include short interfering RNA (siRNA), double-
CC   stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs
CC   can be unmodified or chemically modified, can contain
CC   deoxyribonucleotides, and can be chemically synthesised, expressed from a
CC   vector or enzymatically synthesised. The invention also relates to kits
CC   for the in vitro or in vivo delivery of siNA; conjugates and/or complexes
CC   of siNA; and vectors that express siNA. The siNAs are used to modulate
CC   expression of the HIV gene in cells, tissue explants or organisms (e.g.,
CC   by ex vivo gene therapy), or in grafts and transplants for the treatment
CC   of a variety of conditions. HIV siNAs have anti-HIV activity. They may be
CC   used for inhibiting replication of HIV and may be used to treat HIV
CC   infection. The siNAs are also useful for drug screening, diagnosis,
CC   therapeutic target identification and validation, genetic engineering,
CC   pharmacogenomics, studying gene function, and gene mapping (e.g., of
CC   single nucleotide polymorphisms). The present sequence represents the
CC   upper strand of HIV-targeted double-stranded siNA, which is identical to
CC   the HIV transcript target sequence.

PT   pyrimidine bases.
XX
PS   Example 3; SEQ ID NO 894; 170pp; English.
XX
CC   The invention relates to short interfering nucleic acids (siNA) which
CC   downregulate expression of HIV gene by RNA interference. The siNAs may or
CC   may not comprise ribonucleotides and may be double or single stranded.
CC   They further comprise sense and antisense regions, or alternatively are
CC   assembled from a sense oligonucleotide and an antisense oligonucleotide.
CC   Specifically, the siNAs include short interfering RNA (siRNA), double-
CC   stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs
CC   can be unmodified or chemically modified, can contain
CC   deoxyribonucleotides, and can be chemically synthesised, expressed from a
CC   vector or enzymatically synthesised. The invention also relates to kits
CC   for the in vitro or in vivo delivery of siNA; conjugates and/or complexes
CC   of siNA; and vectors that express siNA. The siNAs are used to modulate
CC   expression of the HIV gene in cells, tissue explants or organisms (e.g.,
CC   by ex vivo gene therapy), or in grafts and transplants for the treatment
CC   of a variety of conditions. HIV siNAs have anti-HIV activity. They may be
CC   used for inhibiting replication of HIV and may be used to treat HIV
CC   infection. The siNAs are also useful for drug screening, diagnosis,
CC   therapeutic target identification and validation, genetic engineering,
CC   pharmacogenomics, studying gene function, and gene mapping (e.g., of
CC   single nucleotide polymorphisms). The present sequence represents the
CC   lower strand of an HIV-targeted double-stranded siNA.

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 10451; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of

```
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO

PT   Pharmaceutical composition for treating asthma, has antisense
PT   oligonucleotide containing less percentage of adenosine, targeted to
PT   nucleic acids associated with lung airway or lung dysfunction, and
PT   bronchodilating agent.
XX
PS   Claim 15; SEQ ID NO 10451; 763pp; English.
XX
CC   This invention describes a novel composition (a) a first active agent,
CC   comprising oligonucleotides, effective for alleviating
CC   bronchoconstriction, respiratory tract inflammation, allergies and
CC   reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC   surfactant depletion or hyposecretion, when administered to a mammal. The
CC   oligonucleotides are derived from a gene encoding or regulating
CC   expression of a target polypeptide associated with lung airway or lung
CC   dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC   The invention also describes a kit, that comprises: (a) a delivery
CC   device, in separate containers, (b) the oligonucleotides, (c)
CC   instructions for adding a carrier and for use of the kit. The composition
CC   of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC   analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC   beta-adrenergic agonist. The composition is useful for preventing or
CC   treating a respiratory, lung or malignant disease. The administered
CC   composition comprises oligo and is administered to reduce the production
CC   or availability, or to increase the degradation of the target mRNA or to
CC   reduce the amount of target polypeptide present in the lungs. The
CC   pulmonary obstruction, and/or bronchoconstriction and/or lung
CC   inflammation, allergies and/or surfactant hypoproduction are associated
CC   with a disease or condition such as pulmonary vasoconstriction,
CC   inflammation, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC   transplantation rejection, pulmonary infections, bronchitis or cancer.
CC   The reduced adenosine content of the anti-sense oligos corresponding to
CC   thymidines present in the target RNA serves to prevent the breakdown of
CC   the oligonucleotides into products that free adenosine into the system
CC   e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC   prevent any unwanted effects due to it

PT   Detecting genetic alterations associated with cancer comprises providing
PT   a target nucleic acid from a patient sample having a predetermined
PT   sequence in the normal population, and assessing the nucleic acid for
PT   loss of heterozygosity.
XX
PS   Example 1; SEQ ID NO 191; 50pp; English.
XX
CC   The present invention describes a method for determining a genetic
CC   alteration in a nucleic acid for the diagnosis and management of
CC   malignant disease. The method comprises providing a target nucleic acid
CC   from a patient sample, the target nucleic acid having a predetermined
CC   sequence in the normal population; and assessing the target nucleic acid
CC   for the extent of loss of heterozygosity relative to predetermined loci,
CC   an increased loss of heterozygosity being correlated with enhanced tumour
CC   invasiveness and metastasis. Also described is a method for determining
CC   the presence or absence of at least one specific nucleotide in a target
CC   nucleic acid for the diagnosis and management of malignant disease. The
CC   methods are useful in detecting genetic alterations (e.g. single
```

```
CC   nucleotide polymorphisms (SNPs)) in a defined polynucleotide region as a
CC   means to diagnose and manage malignant diseases such as cancer. The
CC   present sequence represents a PCR primer used to amplify genomic DNA
CC   corresponding to known SNPs located in predetermined regions of human
CC   chromosome 1, which is used in an example from the present invention.

PT   New isolated and purified nucleic acid encoding nephroretinin or
PT   nephrocystin-4, useful for treating cystic kidney disease or for drug
PT   screening applications.
XX
PS   Example 1; SEQ ID NO 48; 175pp; English.
XX
CC   The invention relates to a novel isolated and purified nucleic acid. The
CC   nucleic acid of the invention demonstrates nephrotropic activity and may
CC   be useful for drug screening applications for compounds that alter
CC   signaling within the nephroretinin (nephphrocystin-4; NPHP4) pathway, as
CC   well as in yeast two-hybrid screening assays and gene therapy. The
CC   nucleic acid may also be used for treating cystic kidney disease. The
CC   current sequence is that of a PCR primer used during mutational analysis
CC   of human nephroretinin of the invention.

XX
CC   The present invention relates to an analytical chip for simultaneous
CC   determination of one or more different bacterial 16S-rRNA in liquid
CC   sample. The chip is useful for detecting one or more bacterial 16S-rRNA,
CC   derived from bacteria such as Achromobacter xylosoxidans , Acinetobacter
CC   baumannii , Actinomyces israelii , Aerococcus viridans , Aeromonas
CC   hydrophilia , Agrobacterium radiobacter , Bacillus sp. , Bacteroides
CC   ovatus , Campylobacter fetus , Citrobacter freundii , Enterococcus avium
CC   , Eubacterium lentum , Escherichia coli , Flavobacterium breve ,
CC   Fusobacterium nucleatum , Gemella morbillorum , Gardnerella vaginalis ,
CC   Haemophilus influenzae , Hafnia alvei , Kingella sp. , Klebsiella oxytoca
CC   , Lactobacillus acidophilus , Legionella pneumophila , Moraxella
CC   catarrhalis , Mycobacterium avium , Neisseria cinerea , Nocardia sp. ,
CC   Ochrobactrum anthropi , Pasteurella multocida , Peptostreptococcus magnus
CC   , Salmonella typhi , Shigella sonnei , Veillonella parvula , Veillonella
CC   sp. or Yersinia enterocolitica . The chip is useful for detecting
CC   clinically relevant bacteria. The chip enables determination of one or
CC   more different bacterial 16S-rRNA in a liquid sample, simultaneously and
CC   enables rapid, accurate, easy and reliable identification of bacteria by
CC   genotypic characterization in a provided sample and also enables
CC   identification of a bacterium even in a complex biological sample. The
CC   chip which is produced at reduced cost, enables determination of 16S-rRNA
CC   in a sample with reduced experimental error and variation. The present
CC   sequence represents a probe of the invention used as an analytical chip.

PT New genetic variants having polymorphisms in the G protein, GNB3 gene,
PT useful for treating disorders with abnormal expression or function of the
PT GNB3 gene, such as asthma, obesity, hypertension and left ventricular
PT hypertrophy.

```
XX
PS   Claim 16; Page 14; 88pp; English.
XX
CC   The invention relates to an isolated polypeptide which comprises a first
CC   nucleotide sequence which is a polymorphic variant of a reference
CC   sequence for the guanine nucleotide binding protein (G protein), beta
CC   polypeptide 3 (GNB3) gene or fragment. Polymorphic variants of the GNB3
CC   gene are useful in studying the expression and biological function of
CC   GNB3 and in identifying drugs targetting GNB3 protein for treating
CC   disorders associated with abnormal expression or function of GNB3, e.g.
CC   hypertension, obesity, asthma and left ventricular hypertrophy.
CC   Polynucleotides comprising a polymorphic gene variant or fragment may be
CC   used for therapeutic purposes, where a patient could benefit from
CC   expression or increased expression of a particular GNB3 gene isoform or
CC   an expression vector encoding the isoform may be administered to the
CC   patient. Haplotype information is useful in improving the efficiency and
CC   output of several steps in drug discovery and development process,
CC   including target validation, identifying lead compounds and early phase
CC   clinical trials. The invention is used in gene therapy. The present
CC   sequence is human GNB3 gene polymorphisms detecting ASO (allele specific
CC   oligonucleotide) primer

PT   hypertrophy.
XX
PS   Claim 16; Page 14; 88pp; English.
XX
CC   The invention relates to an isolated polypeptide which comprises a first
CC   nucleotide sequence which is a polymorphic variant of a reference
CC   sequence for the guanine nucleotide binding protein (G protein), beta
CC   polypeptide 3 (GNB3) gene or fragment. Polymorphic variants of the GNB3
CC   gene are useful in studying the expression and biological function of
CC   GNB3 and in identifying drugs targetting GNB3 protein for treating
CC   disorders associated with abnormal expression or function of GNB3, e.g.
CC   hypertension, obesity, asthma and left ventricular hypertrophy.
CC   Polynucleotides comprising a polymorphic gene variant or fragment may be
CC   used for therapeutic purposes, where a patient could benefit from
CC   expression or increased expression of a particular GNB3 gene isoform or
CC   an expression vector encoding the isoform may be administered to the
CC   patient. Haplotype information is useful in improving the efficiency and
CC   output of several steps in drug discovery and development process,
CC   including target validation, identifying lead compounds and early phase
CC   clinical trials. The invention is used in gene therapy. The present
CC   sequence is human GNB3 gene polymorphisms detecting ASO (allele specific
CC   oligonucleotide) probe

PT   Detecting mastitis by identifying in milk DNA indicating inflammation and
PT   bacterial infection - also DNA indicative of antibiotic resistance,
PT   provides rapid diagnosis, identifies causative agent and suggests
PT   suitable treatment.
XX
PS   Example 7; Page 20; 56pp; English.
XX
CC   PCR primers AAV02659 and AAV02660 are used to amplify a eukaryotic 18S
CC   rRNA gene which is used in a novel assay to diagnose mastitis in milk.
CC   The method involves the detection of a 16S-23S rRNA intergenic spacer
CC   region from pathogenic bacteria known to be a common cause of bovine
CC   mastitis. This amplified 18S rRNA region is used to distinguish
CC   eukaryotic DNA from prokaryotic and viral DNA which allows an estimation
CC   of somatic cell count and therefore an indication of inflammation. This
CC   method is particularly useful for the detection of mastitis caused by
CC   Streptococcus or Staphylococcus species. The method is rapid, does not
CC   involve isolation of cells or bacteria and may allow the causative agent
CC   to be identified. (Updated on 25-MAR-2003 to correct PI field.)

PT   New nucleic acid for the lung disease marker LU105 - polypeptides,
PT   antibodies and genes, used for diagnosis, prevention, treatment of lung
PT   disease, specifically cancer.
XX
PS   Example 2; Page 95; 123pp; English.
XX
CC   This primer is used for the sequencing of the LU105 specific
CC   polynucleotide sequences shown in AAV54616 to AAV54621. The LU105
CC   speciific sequences are used in the method of the invention for detecting
CC   target LU105 nucleic acid. The method comprises treating a sample with at
CC   least one LU105 specific nucleic acid, or its complement which is at
CC   least 50 percent identical with the LU105 specific nucleic acid sequences
CC   (AAV54616 to AAV54621). LU105 is a lung disease marker. Cells transformed
CC   with a recombinant expression system that contains LU105 specific nucleic
CC   acid fragments, are used to express recombinant LU105 polypeptides which
CC   are used to raise antibodies. The antibodies are used to detect the LU105
CC   antigen, and correspondingly this antigen is used to detect specific
CC   antibodies, in usual immunoassays. The LU105 polypeptides and nucleic
CC   acid sequences are used for diagnosis, staging, monitoring, prognosis,
CC   prevention, treatment and determination of susceptibility to, lung
CC   disease, specifically cancer. The LU105 polypeptides are also used to
CC   screen for specific binding agents, useful therapeutically. LU105 is a
CC   marker for lung disease (present at high concentration, in altered form
CC   or in an unusual body compartment). LU105 can be detected in blood,
CC   plasma or serum in an inexpensive, non-invasive test. (Updated on 25-MAR-
CC   2003 to correct PI field.)

CC   AAX09121-X10268 are allele-specific oligonucleotide primers used in the
CC   isolation of various biallelic polymorphic markers found in the human
CC   genome (represented in AAX10269-X12937). These primers can be used in a
CC   method for determining polymorphic forms in an individual for use in e.g.
CC   forensics, paternity testing or for phenotypic typing for diseases such
CC   as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC   dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial
CC   hypercholesterolemia, polycystic kidney disease, hereditary
CC   spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary
CC   haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos
CC   syndrome, osteogenesis imperfecta, acute intermittent porphyria,
CC   autoimmune diseases, inflammation, cancer, diseases of the nervous
CC   system, infection by pathogenic microorganisms, and characteristics such
CC   as longevity, appearance (e.g. baldness, obesity), strength, speed,
CC   endurance, fertility, and susceptibility or receptivity to particular
CC   drugs or therapeutic treatments. The isolated polymorphic nucleic acid
CC   segments can also be used to produce medicaments for the treatment or
CC   prophylaxis of such diseases

PT   New composition useful for inhibiting or treating infections against
PT   negative-strand RNA virus.
XX
PS   Disclosure; Page 20; 98pp; English.
XX
CC   The specification describes a composition comprising a polynucleotide
CC   consisting of an antisense oligonucleotide containing a hydroxy group,
CC   complementary to the genomic or antigenomic strand of a negative-strand
CC   RNA virus; and an activator of RNase L. The polynucleotide is used to
CC   inhibit, or treat, infection by negative-strand RNA viruses, specifically
CC   respiratory syncytial virus (RSV) but also (para)influenza, mumps, and
CC   rabies. The polynucleotide can cross cell membranes without requiring
CC   carriers or permeabilizing agents, and can selectively cleave the RNA
CC   targeted by the oligonucleotide. The present sequence represents an
CC   activator-antisense complex of the invention

PT   New isolated cereal plant enzyme genes used for, e.g. expression of
PT   antisense sequences of granule bound synthase.
XX
PS   Example 6; Page 26; 171pp; English.
XX
CC   The invention relates to a novel enzyme of starch biosynthetic pathway in
CC   a cereal plant, where the enzyme is selected from starch branching enzyme
CC   (SBE) I , SBE II, starch soluble synthase (SSS) I, and debranching enzyme
CC   (DBE), with the proviso that the enzyme is not SSS I of rice, or SBE I of
CC   rice or maize. The methods and products can be used for targeting
CC   expression specifically to the endosperm of the seeds of cereal plants
CC   such as wheat or barley. They can be used for the expression of e.g.
CC   antisense sequences of granule-bound synthase (GBSS), SBE II, low mol.
CC   wt. glutenin, grain softness protein I, bacterial isoamylase, bacterial
CC   glycogen synthase, and wheat high mol. wt. glutenin Bx17. They can be
CC   used for modifying the characteristics of starch produced by a plant.
CC   Primers AAX34642-45 are used for the cloning of the cDNA corresponding to
CC   the wSBE I-D4 gene

PT   New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves
PT   RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1,
PT   PCNA and Cyclin B1.
XX
PS   Disclosure; Page 98; 109pp; English.
XX
CC   The present invention relates to a hairpin or hammerhead ribozyme,
CC   designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase
CC   other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
CC   Representative examples of ribozyme recognition sites are given in
CC   AAA82415 to AAA86787. The ribozyme of the invention is useful for
CC   inhibiting restenosis by introduction of the ribozyme into cells. The
CC   ribozyme is resistant to endonuclease activity and hence is efficient in
CC   restenosis treatment

PT New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves
PT RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1,
PT PCNA and Cyclin B1.
XX
PS Disclosure; Page 67; 109pp; English.
XX
CC The present invention relates to a hairpin or hammerhead ribozyme,
CC designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase
CC other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
CC Representative examples of ribozyme recognition sites are given in
CC AAA82415 to AAA86787. The ribozyme of the invention is useful for
CC inhibiting restenosis by introduction of the ribozyme into cells. The
CC ribozyme is resistant to endonuclease activity and hence is efficient in
CC restenosis treatment

PT   New kallikrein-like (KLK-L) proteins for diagnosing and treating KLK-L
PT   protein mediated disorders, especially cancer.
XX
PS   Example 4; Page 79; 184pp; English.
XX
CC   The present sequence is a PCR primer used for gene-specific amplification
CC   of the normal epithelia cell-specific 1 (NES1) gene. It was amplified as
CC   a control in a method for amplifying kallikrein genes. Kallikreins and
CC   kallikrein-like proteins are a subgroup of the serine protease enzyme
CC   family. They catalyse the selective cleavage of specific polypeptide
CC   precursors to release peptides with potent biological activity. Nucleic
CC   acids encoding kallikrein-like proteins KLK-L1, KLK-L2, KLK-L3, KLK-L4,
CC   KLK-L5 and KLK-L6 have been isolated. The proteins are useful in the
CC   treatment, monitoring and diagnosis of cancers, especially prostrate
CC   cancer. They can also be used to identify a substance that can associate
CC   with or mediate the biological activity of the proteins. Antibodies can
```

```
CC   be used to treat conditions mediated by the kallikrein-like proteins

XX
PS   Disclosure; Page 198; 215pp; English.
XX
CC   The present invention relates to human tumour suppressor gene 16 (TSG16;
CC   see AAH23688). TSG16 was isolated from chromosome 16q24.3. TSG16
CC   suppresses cellular proliferation. TSG16 is useful for treating disorders
CC   associated with decreased expression or activity of TSG16, e.g. cancers,
CC   (auto)immune disorders, inflammation, complications of wound healing and
CC   infections (by viruses, bacteria, fungi, parasites, protozoa or
CC   helminths). The present sequence is a PCR primer, which was used in the
CC   present invention

PT   New isolated nucleic acid encoding a new G-protein coupled receptor
PT   polypeptide for detecting receptor modulators that can treat mental
PT   disorders, such as schizophrenia, anxiety, depression, or obesity.
XX
PS   Example 2; Page 109; 279pp; English.
XX
CC   Sequences AAS42806-AAS42926 represent cDNA molecules and PCR primers for
CC   cDNA molecules encoding human G-protein coupled receptor (GPCR)
CC   polypeptides. The protein and DNA sequences of the invention can be used
CC   to identify compounds which bind to GPCR polypeptides and in screening
CC   for compounds that modulate GPCR activity. By screening a human subject
CC   for the presence of mutations in GPCR DNA, a GPCR-related disorder or a
CC   genetic predisposition can be diagnosed. The sequences can also be used
CC   for treatment and prevention of mental disorders such as schizophrenia,
CC   attention deficit disorder, anxiety, depression, dementia and bipolar
CC   disorder, neurological disorders such as Huntington's disease,
CC   Parkinson's disease and Tourette's syndrome, metabolic disorders such as
CC   obesity, anorexia and type 2 diabetes, cardiovascular disorders such as
CC   thrombosis, myocardial infarction, cardiomyopathy and atherosclerosis,
CC   viral infections caused by HIV and cancers

PT Treating proliferative skin or eye diseases and scarring, using ribozymes
PT that cleave RNA encoding cytokines involved in inflammation, matrix
PT metalloproteinases, growth factors and cell-cycle dependent kinases.
XX
PS Example 1; Page 173; 408pp; English.
XX
CC The present invention describes a method for treating a proliferative
CC skin or eye disease and scarring. The method involves administering a
CC ribozyme (I) which cleaves RNA encoding a cytokine involved in
CC inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
CC dependent kinase, growth factor or a reductase, or administering a
CC nucleic acid molecule (II) comprising a promoter operably linked to a
CC nucleic acid segment encoding (I). (I) can have antipsoriatic,
CC dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,
CC ophthalmological, vulnerary, keratolytic and virucide activities, and
CC cleaves RNA encoding cytokine involved in inflammation. (I) can be used
CC in gene therapy. (I) and (II) are useful for treating proliferative skin
CC diseases such as psoriasis, atopic dermatitis, actinic keratosis,
CC squamous or basal cell carcinoma and viral or seborrheic wart. They can
CC also be used for treating proliferative eye diseases such as diabetic
CC retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
CC prematurity and retinal detachment, and for treating and preventing
CC scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
CC scar. AAH57577 to AAH62099 represent sequences used in the
CC exemplification of the present invention

PT   Treating proliferative skin or eye diseases and scarring, using ribozymes
PT   that cleave RNA encoding cytokines involved in inflammation, matrix
PT   metalloproteinases, growth factors and cell-cycle dependent kinases.
XX
PS   Example 1; Page 173; 408pp; English.
XX
CC   The present invention describes a method for treating a proliferative
CC   skin or eye disease and scarring. The method involves administering a
CC   ribozyme (I) which cleaves RNA encoding a cytokine involved in
CC   inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
CC   dependent kinase, growth factor or a reductase, or administering a
CC   nucleic acid molecule (II) comprising a promoter operably linked to a
CC   nucleic acid segment encoding (I). (I) can have antipsoriatic,
CC   dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,
CC   ophthalmological, vulnerary, keratolytic and virucide activities, and
CC   cleaves RNA encoding cytokine involved in inflammation. (I) can be used
CC   in gene therapy. (I) and (II) are useful for treating proliferative skin
CC   diseases such as psoriasis, atopic dermatitis, actinic keratosis,
CC   squamous or basal cell carcinoma and viral or seborrheic wart. They can
CC   also be used for treating proliferative eye diseases such as diabetic
CC   retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
CC   prematurity and retinal detachment, and for treating and preventing

PT   New alpha catenin polypeptides and polynucleotides encoding them, useful
PT   for predicting, diagnosing or treating cadherin-catenin related diseases,
PT   particularly cardiomyopathies, cancer and male infertility.
XX
PS   Example; Page 34; 132pp; English.
XX
CC   The invention relates to human and mouse alpha-catenin polypeptides and
CC   their associated polynucleotides. The polypeptides and related antibodies
CC   are useful for modulating the cadherin-catenin related pathway in
CC   selected organs, such as the heart and testis. The nucleic acids and the
CC   antibodies are useful in the diagnosis and/or prediction of the
CC   likelihood of developing cadherin-catenin related diseases. The nucleic
CC   acids may also be used to predict the likelihood of developing cancer or
CC   in diagnosing cancer, and in gene therapy. The polypeptide, the nucleic
CC   acid or the antibody is useful in manufacturing a medicament for treating
CC   cadherin-catenin related diseases, such as cancer, cardiomyopathy,
CC   specifically dilated cardiomyopathy, and male infertility. Sequences
CC   ABK41474-ABK41509 represent splice donors and splice acceptors of the
CC   CTNNA3 gene which encodes human alpha T-catenin

PT   Detecting methylation status of test DNA in a mixture, useful for
PT   diagnosis and prognosis of disease, comprises bisulfite treatment then
PT   selective amplification of test DNA.
XX
PS   Example 2; Page 39; 82pp; German.
XX
CC   This invention describes a novel method for detecting cytosine
CC   methylation in DNA samples by: (i) chemically treating a genomic sample
CC   to convert all non-methylated cytosines to uracil while leaving
CC   methylated cytosines unchanged; (ii) amplification with 2 primer
CC   oligonucleotides and a polymerase; and (iii) analysis of the amplicon and
CC   deducing the methylation status of test DNA. The method is used for
CC   determining the methylation status at different CpG positions, which is
CC   used for diagnosis and/or prognosis of a very wide range of disorders,
CC   e.g. side-effects of pharmaceuticals, cancer, cardiovascular or
CC   gastrointestinal diseases, infections, inflammation, etc. The method is
CC   also useful for differentiating between cell and tissue types and for
CC   investigating cell differentiation. The method: (i) provides a
CC   quantitative indication of the different methylated positions, and thus a
CC   very accurate classification; and (ii) eliminates interference from
CC   background DNA, making it suitable for analysis of serum or body fluids
CC   (which contain background DNA in large excess). This sequence represents
CC   a primer used in the detection of cytosine methylation in the human GSTp1
CC   gene (glutathione-S-transferase p1) described in the disclosure of the
CC   invention

PT   Arraying genome clones.
XX
PS   Claim 4; Page 48; 528pp; Japanese.
XX
CC   The present invention describes a method of arraying genome clones. The
CC   method comprises: (a) clones of the genomic libraries contained in
CC   multiwell plates numbered for discrimination are mixed in each of the
CC   multiwell plates; (b) a primer designed based on the chromosome marker
CC   sequence is added to the mixture to carry out an amplification reaction;
CC   (c) a signal corresponding to the marker is detected from the resultant
CC   amplified product to specify the discrimination Nos. of the multiwell
CC   plates containing the clones having said marker sequence; (d) the order
CC   of the markers is changed so that the same discrimination Nos. succeed to
CC   the maximum in the specified discrimination Nos. to array the multiwell
CC   plates; (e) the clones in the multiwell plates of the specified
CC   discrimination Nos. are mixed respectively in each wells of longitudinal
CC   and lateral directions; (f) the mixed clones are cultured and the
CC   resultant cultures are amplified by using the above primer; (g) signals
CC   are detected from the amplified products; (h) the clones in the multiwell
CC   plates are specified from the detected result; and (i) the clones are
CC   reconstituted as the positions on the chromosome and arrayed. The
CC   microarray is useful for gene analysis. ABL42957 to ABL45322 represent
CC   PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634
CC   represent PCR primers for human chromosome 21q22.1, which are

PT New short interfering nucleic acid downregulates expression of the c-fos
PT gene useful for treatment and diagnosis of diseases, e.g. cancer and

PT inflammation.
XX
PS Example 3; SEQ ID NO 41; 145pp; English.
XX
CC The invention relates to short interfering nucleic acids (siNA) which
CC downregulate expression of the human c-fos gene by RNA interference. The
CC siNAs may or may not comprise ribonucleotides and may be double or single
CC stranded. They further comprise sense and antisense regions, or
CC alternatively are assembled from a sense oligonucleotide and an antisense
CC oligonucleotide. Specifically, the siNAs include short interfering RNA
CC (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA
CC (shRNA). The siNAs can be unmodified or chemically modified, can contain
CC deoxyribonucleotides, and can be chemically synthesised, expressed from a
CC vector or enzymatically synthesised. The invention also relates to kits
CC for the in vitro or in vivo delivery of siNA; conjugates and/or complexes
CC of siNA; and vectors that express siNA. The siNAs are used to modulate
CC expression of the c-fos gene in cells, tissue explants or organisms
CC (e.g., by ex vivo gene therapy), or in grafts and transplants for the
CC treatment of a variety of conditions. They may be used for treating
CC central nervous system lesions and injuries (e.g., Alzheimer's disease,
CC Parkinson's disease, Huntington's disease, epilepsy, dementia or
CC amyotrophic lateral sclerosis); various cancers; other proliferative
CC diseases (e.g., restenosis and polycystic kidney disease); inflammatory
CC and/or allergic diseases; viral infections (including HIV infection);
CC autoimmune diseases; and transplant rejection. The siNAs are also useful
CC for drug screening, diagnosis, therapeutic target identification and
CC validation, genetic engineering, pharmacogenomics, studying gene
CC function, and gene mapping (e.g., of single nucleotide polymorphisms).
CC The present sequence represents the upper strand of a human c-fos-
CC targeted double-stranded siNA, which is identical to the c-fos transcript
CC target sequence.

PT New short interfering nucleic acid downregulates expression of the c-fos
PT gene useful for treatment and diagnosis of diseases, e.g. cancer and
PT inflammation.
XX
PS Example 3; SEQ ID NO 157; 145pp; English.
XX
CC The invention relates to short interfering nucleic acids (siNA) which
CC downregulate expression of the human c-fos gene by RNA interference. The
CC siNAs may or may not comprise ribonucleotides and may be double or single
CC stranded. They further comprise sense and antisense regions, or
CC alternatively are assembled from a sense oligonucleotide and an antisense
CC oligonucleotide. Specifically, the siNAs include short interfering RNA
CC (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA
CC (shRNA). The siNAs can be unmodified or chemically modified, can contain
CC deoxyribonucleotides, and can be chemically synthesised, expressed from a
CC vector or enzymatically synthesised. The invention also relates to kits
CC for the in vitro or in vivo delivery of siNA; conjugates and/or complexes
CC of siNA; and vectors that express siNA. The siNAs are used to modulate
CC expression of the c-fos gene in cells, tissue explants or organisms
CC (e.g., by ex vivo gene therapy), or in grafts and transplants for the
CC treatment of a variety of conditions. They may be used for treating
CC central nervous system lesions and injuries (e.g., Alzheimer's disease,
CC Parkinson's disease, Huntington's disease, epilepsy, dementia or
CC amyotrophic lateral sclerosis); various cancers; other proliferative
CC diseases (e.g., restenosis and polycystic kidney disease); inflammatory
CC and/or allergic diseases; viral infections (including HIV infection);
CC autoimmune diseases; and transplant rejection. The siNAs are also useful
CC for drug screening, diagnosis, therapeutic target identification and
CC validation, genetic engineering, pharmacogenomics, studying gene
CC function, and gene mapping (e.g., of single nucleotide polymorphisms).
CC The present sequence represents the lower strand of a human c-fos-
CC targeted double-stranded siNA.

PT   In vitro detection of tumor cells, in a biological sample, uses a
PT   highlight of allelic imbalance in insertion-deletion chromosome markers.
XX
PS   Claim 15; SEQ ID NO 96; 51pp; French.
XX
CC   The invention relates to a method of in vitro detection of cancer tumor
CC   cells, in a biological sample, where allelic imbalances are highlighted
CC   in insertion-deletion chromosome markers. The markers are given a
CC   quantitative multiplex amplification by polymerase chain reaction (PCR),
CC   triggered by heat. A calculation is made of a global statistical score
CC   for all the markers being studied, for comparison with a fixed normal
CC   threshold. The technique is especially for the detection of bladder tumor
CC   cells in a urine sample, using a blood sample as the reference. The non-
CC   invasive method gives evidence of an allelic imbalance with at least 15
CC   chromosome insertion-deletion markers and preferably 18, or at least 30
CC   or at least 40 markers. This sequence represents a primer used in the
CC   method of the invention.

PS   Example 3; SEQ ID NO 102; 164pp; English.
XX
CC   The present invention describes a short interfering nucleic acid (siNA)
CC   that downregulates expression of a mitogen-activated protein kinase
CC   (MAPK) genes by RNA interference. Also described: (1) a method for
CC   modulating expression of MAPK genes in cells, tissue explants or
CC   organisms by introduction of siNA; (2) kits for in vitro or in vivo
CC   delivery of siNA; (3) conjugates and/or complexes of siNA; and (4)
CC   vectors that express siNA and cells containing these vectors. MAPK siNAs
CC   have cytostatic, anorectic, antidiabetic, antiinflammatory,
CC   antiasthmatic, immunosuppressive, antibacterial, antirheumatic,
CC   antiarthritic, antipsoriatic and gastrointestinal activities. The MAPK
CC   siNAs can be used to modulate the expression of MAPK genes, in cells,
CC   tissue explants or organisms, e.g. for treating obesity; diabetes types I
CC   and II; a wide range of tumours, and inflammatory diseases (asthma,
CC   septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel
CC   disease). They can also be used for drug screening; diagnosis; target
CC   identification and validation; genetic engineering; pharmacogenomics;
CC   studying gene function and gene mapping (e.g. of single-nucleotide
CC   polymorphisms). The present sequence represents a MAPK siNA which is used
CC   in the exemplification of the present invention.

PT   New short interfering nucleic acid, useful e.g. for treatment and
PT   diagnosis of cancer , downregulates expression of a protein tyrosine
PT   phosphatase type IVa gene.
XX
PS   Example 3; SEQ ID NO 67; 131pp; English.
XX
CC   The invention relates to a novel short interfering nucleic acid (siNA)
CC   that downregulates expression of a protein tyrosine phosphatase type IV
CC   (PRL3) gene by RNA interference. The invention further relates to
CC   modulating the expression of PRL3 genes in cells, tissue explants or
CC   organisms by the introduction of an siNA; kits for in vitro or in vivo
CC   delivery of an siNA; conjugates and/or complexes of siNA; and vectors
CC   that express siNA. The novel siNA's of the invention have cytostatic
CC   activity. siNA's are used to modulate expression of PRL3 genes, in cells,
CC   tissue explants or organisms, e.g. for treating cancer but also for drug
CC   screening; diagnosis; target identification and validation; genetic
CC   engineering; pharmacogenomics; studying gene function and gene mapping
CC   (e.g. of single-nucleotide polymorphisms). This polynucleotide sequence
CC   represents a short interfering nucleic acid for downregulating the
CC   expression of a protein tyrosine phosphatase type IV (PRL3) gene of the
CC   invention.

XX
CC   The invention relates to short interfering nucleic acids (siNA) which
CC   downregulate expression of the human Checkpoint Kinase-1 (CHK-1) gene by
CC   RNA interference. The siNAs may or may not comprise ribonucleotides and
CC   may be double or single stranded. They further comprise sense and
CC   antisense regions, or alternatively are assembled from a sense
CC   oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs
CC   include short interfering RNA (siRNA), double-stranded RNA, micro-RNA
CC   (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or
CC   chemically modified, can contain deoxyribonucleotides, and can be
CC   chemically synthesised, expressed from a vector or enzymatically
CC   synthesised. The invention also relates to kits for the in vitro or in
CC   vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors
CC   that express siNA. The siNAs are used to modulate expression of the CHK-1
CC   gene in cells, tissue explants or organisms (e.g., by ex vivo gene
CC   therapy), or in grafts and transplants for the treatment of a variety of
CC   conditions. They may be used for treating cancer and restenosis. The
CC   siNAs are also useful for drug screening, diagnosis, therapeutic target
CC   identification and validation, genetic engineering, pharmacogenomics,
CC   studying gene function, and gene mapping (e.g., of single nucleotide
CC   polymorphisms). The present sequence represents the upper strand of a
CC   human CHK-1-targeted double stranded siNA, which is identical to the CHK-
CC   1 transcript target sequence.

CC unmodified or chemically modified, can contain deoxyribonucleotides, and
CC can be chemically synthesised, expressed from a vector or enzymatically
CC synthesised. The invention also relates to kits for the in vitro or in
CC vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors
CC that express siNA. The siNAs are used to modulate expression of the TNF
CC receptor gene in cells, tissue explants or organisms (e.g., by ex vivo
CC gene therapy), or in grafts and transplants for the treatment of a
CC variety of conditions. The TNF receptor siNAs have antibacterial,
CC immunosuppressive, antirheumatic, antiarthritic, anti-HIV, antipsoriatic
CC and antiinflammatory activities. They may be used for treating septic
CC shock, rheumatoid arthritis, HIV/AIDS, psoriasis, inflammation and
CC autoimmune diseases. The siNAs are also useful for drug screening,
CC diagnosis, therapeutic target identification and validation, genetic
CC engineering, pharmacogenomics, studying gene function, and gene mapping
CC (e.g., of single nucleotide polymorphisms). The present sequence
CC represents the lower strand of a human TNF receptor-targeted double-
CC stranded siNA.

XX
CC The invention relates to short interfering nucleic acids (siNA) which
CC downregulate expression of the human tumour necrosis factor (TNF)
CC receptor gene by RNA interference. The siNAs may or may not comprise
CC ribonucleotides and may be double or single stranded. They further
CC comprise sense and antisense regions, or alternatively are assembled from
CC a sense oligonucleotide and an antisense oligonucleotide. Specifically,
CC the siNAs include short interfering RNA (siRNA), double-stranded RNA,
CC micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be
CC unmodified or chemically modified, can contain deoxyribonucleotides, and
CC can be chemically synthesised, expressed from a vector or enzymatically
CC synthesised. The invention also relates to kits for the in vitro or in
CC vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors
CC that express siNA. The siNAs are used to modulate expression of the TNF
CC receptor gene in cells, tissue explants or organisms (e.g., by ex vivo
CC gene therapy), or in grafts and transplants for the treatment of a
CC variety of conditions. The TNF receptor siNAs have antibacterial,
CC immunosuppressive, antirheumatic, antiarthritic, anti-HIV, antipsoriatic
CC and antiinflammatory activities. They may be used for treating septic
CC shock, rheumatoid arthritis, HIV/AIDS, psoriasis, inflammation and
CC autoimmune diseases. The siNAs are also useful for drug screening,
CC diagnosis, therapeutic target identification and validation, genetic
CC engineering, pharmacogenomics, studying gene function, and gene mapping
CC (e.g., of single nucleotide polymorphisms). The present sequence
CC represents the upper strand of a human TNF receptor-targeted double-
CC stranded siNA, which is identical to the TNF receptor transcript target
CC sequence.

PT   Determining origin of an animal sample, useful e.g. for detecting
PT   adulteration of food, by testing hybridization of sample DNA with set of
PT   species-specific reagents.
XX
PS   Claim 1; SEQ ID NO 104; 98pp; French.
XX
CC   The invention relates to a novel method for determining the animal
CC   species that is the origin of a sample. The method is very general, quick
CC   and easy to do. It can detect material from a species even when present
CC   in small amounts in presence of materials from several other species, and
CC   the species being tested do not have to be known a priori. DNA was
CC   isolated from an animal sample and amplified by PCR using two primers.
CC   The amplicon, containing a promoter for RNA T7 polymerase (present in one
CC   of the primers) was transcribed with incorporation of a fluorescent
CC   ribonucleotide, then transcripts cleaved to fragments of 20 nucleotides.
CC   These were tested for hybridisation to a DNA chip carrying 17-mer capture
CC   probes, specific for different animal species. The present sequence
CC   represents a probe of the invention.

PT   New isolated polynucleotides comprising single nucleotide polymorphisms
PT   of the cardiovascular gene, useful for assessing predisposition or
PT   susceptibility to a cardiovascular disease, e.g. atherosclerosis,
PT   restenosis or stroke.
XX
PS   Disclosure; Page 74; 187pp; English.
XX
CC   The invention relates an isolated polynucleotide (I) encoded by a
CC   cardiovascular associated (CA) gene, having allelic variation contained
CC   in a functional surrounding like full length cDNA for CA gene
CC   polypeptide, and with or without the CA gene promoter sequence. (I) is a
CC   polynucleotide comprising single nucleotide polymorphisms predicting
CC   cardiovascular disease. The polynucleotides are useful for assessing
CC   predisposition or susceptibility to a cardiovascular disease, e.g.
CC   atherosclerosis, ischemia/reperfusion, hypertension, restenosis, arterial
CC   inflammation, myocardial infarction, and stroke. These may also be used
CC   to predict personal medication schemes omitting adverse drug reactions,
CC   or as probes for detecting genetic polymorphisms and as templates for the
CC   recombinant production of normal or variant peptides/polypeptides encoded
CC   by the genes. This sequence corresponds to a PCR primer to amplify one of
CC   the genes of the invention.

PT   New small interfering polynucleotide that modulates protein tyrosine
PT   phosphatase (PTP)1B polypeptide signal transduction, useful for treating
PT   disorders associated with altered PTP1B signal transduction, e.g.
PT   diabetes or cancer.
XX
PS   Example 3; SEQ ID NO 478; 234pp; English.
XX
CC   The invention relates to a novel isolated small interfering RNA (siRNA)
CC   polynucleotide, comprising at least one nucleotide sequence from any of
CC   the 20 fully defined sequences given in the specification. The invention
CC   further relates to: a pharmaceutical composition comprising a new siRNA
CC   polynucleotide and a physiological carrier; a recombinant nucleic acid
CC   construct, comprising a polynucleotide that is capable of directing
CC   transcription of an siRNA; a host cell transformed or transfected with
CC   the above recombinant nucleic acid construct; a method for interfering
CC   with expression of a protein tyrosine phosphatase (PTP)1B polypeptide, or
CC   its variant; a method for identifying a component of a PTP1B signal
CC   transduction pathway; a method for modulating an insulin receptor protein
CC   phosphorylation state in a cell; a method for altering a Jak2 protein
CC   phosphorylation state in a cell; and a method for treating a Jak2-
CC   associated disorder. The siRNA has the following activities:
CC   antidiabetic, anorectic, antiinflammatory, neuroprotective, cytostatic,
CC   immunosuppressive, and antimicrobial. The novel siRNA polynucleotides can
CC   be used in gene therapy to treat disorders. The composition and methods
CC   are useful in treating disorders associated with PTP1B-mediated signal
CC   transduction, such as diabetes, obesity, hyperglycaemia-induced
CC   apoptosis, inflammation, neurodegenerative disorders, cancer, autoimmune
CC   diseases or infection. This polynucleotide sequence represents an siRNA
CC   used for modulating the signal transduction of a protein tyrosine
CC   phosphatase of the invention.

PT Achieving transient expression of at least an extracellular non-plant
PT protein from a heterologous nucleotide sequence in moss protoplast
PT comprises transiently introducing into the protoplast a heterologous
PT nucleic acid construct.
XX
PS Disclosure; Page 17; 49pp; English.
XX
CC The specification describes a method for the production of extracellular
CC non-plant protein from moss protoplasts. The method comprises transiently
CC introducing into the protoplast a heterologous nucleic acid construct
CC comprising a heterologous nucleotide sequence operably linked to a
CC promoter. The heterologous nucleotide sequence encodes a protein selected
CC from heterodimer, fusion antibody, immunoglobulin or single-chain
CC antibody. The method is useful for protein production. PCR primers
CC ADM32948-ADM32949 were used to amplify a fragment of cDNA encoding a
CC plant thaumatin-like To32 protein, in the course of the invention.

XX
CC This invention describes novel small interfering RNA (siRNA)
CC polynucleotides capable of interfering with expression of a polypeptide
CC having protein-tyrosine-phosphatase (PTP) activity. The products of the
CC invention have cytostatic, immunomodulator, antimicrobial,
CC antiinflammatory, antidiabetic and anorectic activity. The methods and
CC compositions of the present invention are useful for treating diseases or
CC conditions associated with aberrant expression or activity of the protein
CC tyrosine phosphatase, such as cancer, autoimmune diseases, infection,
CC inflammation, diabetes and obesity. This sequence represents a siRNA
CC directed against dual specificity phosphatase (DSP) expression.

PT   Diagnosing susceptibility to a stroke in an individual comprising
PT   screening for an at-risk haplotype in the phosphodiesterase 4D gene.
XX
PS   Disclosure; SEQ ID NO 451; 574pp; English.
XX
CC   The invention relates to a method of diagnosing susceptibility to a
CC   stroke in an individual comprising screening for an at-risk haplotype in
CC   the phosphodiesterase 4D (PDE4D) gene that is more frequently present in
CC   an individual susceptible to stroke (affected) compared to a healthy
CC   individual (control), where the at-risk haplotype increases risk of
CC   stroke significantly. The composition, methods and kit are useful for
CC   diagnosing, predicting of clinical course and treating stroke using
CC   polymorphisms in the PDE4D gene. These may also be used in identifying
CC   agents that enhance or inhibit PDE4D polypeptide expression or activity.
CC   The present sequence represents a fragment of H. pylori strain J99 genome
CC   which is not referred to at all in the main body of the specification.

PT   Detecting sequence of RNA interference useful for synthesizing siRNA, by
PT   detecting regions in sequence fulfilling specific criteria such as base
PT   at 3' terminal is adenine, thymine or uracil, base at 5' terminal is
PT   guanine or cytosine.
XX
PS   Disclosure; SEQ ID NO 372; 325pp; Japanese.
XX
CC   The invention relates to a method of detecting the base sequence for RNA
CC   interference by detecting the regions in the DNA sequence fulfilling the
CC   following requirements such as: (i) the base at 3' terminal is adenine,
CC   thymine or uracil; (ii) the base at 5' terminal is guanine or cytosine;
CC   (iii) the seven base sequence at 3' terminal is rich in adenine, thymine
CC   and uracil, and; (iv) there are bases in a such a number that it causes
CC   RNA interference without showing cytotoxicity. The method is used for
CC   designing and synthesizing siRNA causing RNA interference. This sequence
CC   corresponds to an RNA interference target sequence of the invention.

PT   in inhibiting disease related genes.
XX
PS   Claim 2; Page 275; 407pp; English.
XX
CC   The present sequence represents a preferred target sequence for an
CC   enzymatic nucleic acid (i.e. a ribozyme) which cleaves mRNA coding for a
CC   protein of respiratory syncytial virus (RSV) at the nucleotide base
CC   position indicated in the DE line. Regions of the mRNA that do not form
CC   secondary folding structures and that contain potential hammerhead and
CC   hairpin ribozyme cleavage sites were identified by computer analysis.
CC   Ribozymes directed against these mRNA sequences were designed and
CC   synthesised with modifications that improve their nuclease resistance.
CC   The ribozymes cleave the target sequences and can be used for treatment
CC   and diagnosis of RSV infection. (Updated on 25-MAR-2003 to correct PI
CC   field.). (Updated on 27-AUG-2003 to correct OS field.)

PT   An array of nucleic acid probes immobilized on a solid support, useful
PT   for identifying mutations in the cystic fibrosis transmembrane
PT   conductance regulator.
XX
PS   Disclosure; Col 107; 114pp; English.
XX
CC   The present invention describes an array of nucleic acid probes
CC   immobilised on a solid support, which comprises: (1) a first probe set,
CC   comprising probes with a segment of at least 6 nucleotides complementary
CC   to the CFTR (cystic fibrosis transmembrane conductance regulator) gene,
CC   where the segment includes at least 1 interrogation position
CC   complementary to a nucleotide in the CFTR gene sequence; and (2) second,
CC   third and fourth probe sets, each comprising probes identical to those in
CC   (1) except that the interrogation position is occupied by a different
CC   nucleotide. AAA05991 to AAA06240 represent CFTR gene analysis
CC   oligonucleotide probes for use in the exemplification of the present
CC   invention. The present invention also describes a method of comparing a
CC   target nucleic acid with a reference sequence consisting of a
CC   predetermined sequence of nucleotides, comprising: (a) hybridising a
CC   sample comprising the target nucleic acid to an array of nucleic acid
CC   probes immobilised on a solid support; (b) comparing the relative
CC   specific binding of two corresponding probes from the first and second
CC   probe sets; (c) assigning a nucleotide in the target sequence as the
CC   complement of the interrogation position of the probe having the greater
CC   specific binding; and (d) repeating (b) and (c) by comparing the relative
CC   specific binding of a further two corresponding probes from the first and
CC   second probe sets until each nucleotide of interest in the target
CC   sequence has been assigned. The array is useful for analysis of the CFTR
CC   gene, e.g. detection of mutations

XX
CC   The present invention related to an improvement to existing chip
CC   detection techniques. The invention uses DNA oligonucleotide probes
CC   (ADF32077-ADF32266) to detect Single Nucleotide Polymorphisms (SNP) in
CC   genomic DNA. Its advantages are simple process and short time (within 2
CC   hr).

PT   Arrays of oligonucleotide probes immobilized in microfabricated patterns
PT   on chips used for detecting mutations in the cystic fibrosis
PT   transmembrane conductance regulator (CFTR) gene.
XX
PS   Disclosure; SEQ ID NO 111; 123pp; English.
XX
CC   The invention relates to an array of oligonucleotide probes immobilised
CC   on a solid support, the array comprising at least two sets of
CC   oligonucleotide probes (a microfabricated array or DNA chip). The arrays
CC   can be used in methods to detect uncommon mutations in the CFTR gene.
CC   Prior art methods for analysis of the cystic fibrosis gene do not monitor
CC   large regions of the CFTR gene. The invention uses a large number of
CC   probes and therefore permits the identification of uncharacterised
CC   mutations and the simultaneous screening of large numbers of mutations
CC   with a high degree of accuracy. The present sequence is used in the
CC   exemplification of the invention.

PT   Detection and treatment of acute leukaemia(s) - using prods. derived from
PT   oligo:nucleotide sequences within the ALL-1 gene of chromosome 11.
XX
PS   Disclosure; Fig 10A; 90pp; English.
XX
CC   The sequences given in AAQ43527-40 show the intron/exon boundary
CC   structures of the acute lymphoblastic leukemia gene (ALL-1) of chromosome
CC   11, in the breakpoint cluster region. The chromosomal region 11q23 has
CC   been shown to be involved in different chromosomal translocations in
CC   human ALL and acute nonlymphoblastic leukemia (ANLL). This region may be
CC   rearranged in acute leukemias with interstitial deletions or reciprocal
CC   translocations between this region and chromosomes 1, 2, 4, 6, 9, 10, 15,
CC   17 or 19. The break- point cluster region of the ALL-1 gene spans approx.
CC   8 kb and encompasses several small exons, esp. exons 6-12, most of which
CC   begin in the same phase of the open reading frame. The most common
CC   translocation which occurs is t(4:11) which results in two reciprocal
CC   fusion products coding for chimeric proteins derived from ALL-1 and a
CC   gene from chromosome 4 termed "AF-4" (see also AAQ43541-42). Therefore it
CC   is thought that each 11q23 abnormality gives rise to a specific oncogenic
CC   fusion protein. The ALL-1 gene was isolated by trans- location breakpoint
CC   mapping. Fragments of the ALL-1 cDNA may be used to identify chromosomal
```

```
CC   abnormalities within the ALL-1 gene. These fragments may be used in the
CC   treatment and diagnosis of human leukemias such as acute lymphocytic,
CC   myelomonocytic, monocytic and myelogenous leukemia. (Updated on 25-MAR-
CC   2003 to correct PN field.)

XX
CC   Clustering of the t(4;11) breakpoints has previously been found within a
CC   small segment of the ALL-1 locus. This region includes 7 coding exons (6-
CC   12) containing 74, 132, 114, 147, 96, 121 and 123 bp, respectively. Exons
CC   8-12 contain four zinc-finger motifs. Exons 7-11 all begin in the first
CC   nucleotide of a codon. Precise mapping of five t(4;11) breakpoints
CC   localised them to introns between exons 6 and 7, 7 and 8, and 8 and 9.
CC   These breaks in chromosome 11 result in removal of the N-terminal 996
CC   amino acids from the ALL-1 protein, as well as in disjoining the 5'-
CC   noncoding region of the gene. (Updated on 25-MAR-2003 to correct PN
CC   field.)

PT New antisense oligonucleotides used in treatment of, e.g. pulmonary
PT vasoconstriction.
XX
PS Disclosure; Page 62; 120pp; English.
XX
CC The specification describes antisense oligonucleotides (AAX52869-X55271)
CC directed against at least 2 mRNAs selected from target genes, coding and
CC non-coding regions of RNAs corresponding to target genes, gene initiation
CC codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
CC -end and the juxta-section between coding and non-coding regions and all
CC segments of RNAs encoding proteins associated with one or more diseases,
CC conditions or mixtures. The antisense oligonucleotides may be derived
CC from sequences AAX55272-74. These multiple target oligonucleotides
CC (specifically AAX55180-271) can be used for the antisense treatment of
CC diseases and conditions. Typical diseases and conditions are those
CC associated with impaired respiration and inflammation, including lung
CC diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC acute asthma, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
CC colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC well as all types of cancers which may metastasize or have metastasized
CC to the lungs, including breast and prostate cancer

PT New antisense oligonucleotides useful for treating e.g. pulmonary
PT vasoconstruction, inflammation, allergies, asthma, hypertension,
PT bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT cancers.
XX
PS Claim 18; Page 448; 1343pp; English.
XX
CC The present invention describes a new composition comprising an antisense
CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC nucleic acids involved in bronchoconstriction, allergies, and/or
CC inflammation. The ON can have antiinflammatory, antiallergic,
CC antiasthmatic, cytostatic and analgesic activities. The compositions are
CC useful for the treatment of diseases associated with inflammation,
CC impaired airways, including lung disease and diseases whose secondary
CC effects afflict the lungs of a subject. They can be used for treating
CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC impeded respiration, respiratory distress syndrome, pain, cystic
CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC carcinomas, and cancers which may metastasise to the lungs, including
CC breast and prostate cancer. The reduction of the adenosine content of the
CC ONs reduces side effects. The A-containing ONs break down with the
CC release of deoxyadenosine which activates adenosine receptors causing
CC bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC nucleotide sequences given in the sequence listing from the present
CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC AAA33992) are specifically claimed ONs from the present invention. N.B.
CC Sequences given in the disclosure of the present invention do not match
CC up with their corresponding SEQ ID NO: sequences given in the sequence
CC listing

PT Detection of drug-selected mutations in the HIV protease gene used to
PT treat HIV infections.
XX
PS Claim 3; Page 37; 76pp; English.
XX
CC The present invention describes the detection of drug-selected mutations
CC in the HIV protease gene. The method of detection allows the simultaneous
CC characterisation of a range of codons involved in drug resistance using
CC sets of probes optimised to function together in a reverse-hybridisation
CC assay. AAZ97517 to AAZ97997 represent specifically claimed probes for use
CC in the assay, and AAZ97479 to AAZ97501 represent specifically claimed HIV
CC protease gene polymorphic nucleotide sequences. AAZ97502 to AAZ97515, and
CC AAZ98004 to AAZ98007, represent PCR primers for the HIV protease gene,
CC and AAZ97516 represents an HIV protease probe used in an example from the
CC present invention. The method, probes and primers can be used for the
CC detection of drug-selected mutations in the HIV protease gene. The method
CC allows the simultaneous characterisation of a range of codons involved in
CC drug resistance. The method may also be used for HIV protease genotyping
CC assays. The probes are able to discriminate between wild type and mutated
CC protease sequences. The method allows rapid and reliable detection of
CC drug-selected mutation in HIV. (Updated on 15-SEP-2003 to standardise OS
CC field)

PT   Low adenosine (A) content antisense oligonucleotides which do not trigger
PT   adenosine receptors during metabolism, useful e.g. for treating cancers
PT   and respiratory obstructions.
XX
PS   Claim 14; Page 256; 1592pp; English.
XX
CC   The present invention describes low adenosine (A) content antisense
CC   oligonucleotides and compositions (I) comprising them. In the antisense
CC   oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC   (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC   immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC   The antisense oligonucleotides and (I) can be used to down-regulate the
CC   expression and or activity of target polypeptides associated with
CC   lung/respiratory disorders and malignancies, such as stimulating and
CC   activating peptide factors and transmitters, transcription factors,
CC   immunoglobulins and antibodies, antibody receptors, cytokines and
CC   chemokines, endogenously produced specific and non-specific enzymes,
CC   binding proteins, adhesion molecules and their receptors, cytokine and
CC   chemokine receptors, adenosine receptors, bradykinin receptors, central
CC   nervous system (CNS) and peripheral nervous and non-nervous system
CC   receptors, CNS and peripheral nervous and non-nervous system peptide
CC   transmitters, defensins, growth factors, vasoactive peptides and
CC   receptors, binding proteins and malignancy associated proteins. The
CC   antisense oligonucleotides may be used in this way to treat disorders
CC   including respiratory obstruction (especially pulmonary obstruction
CC   and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
CC   surfactant hypoproduction which are associated with a disease or
CC   condition selected from pulmonary vasoconstriction, inflammation,
CC   allergies, asthma, impeded respiration, respiratory distress syndrome
CC   (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
CC   pulmonary transplantation rejection, pulmonary infections, bronchitis,
CC   and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
CC   fragments and antisense oligonucleotides used in the exemplification of
CC   the present invention

PT   Novel isolated human nuclear factor associated with dsRNA polypeptide
PT   useful for determining structure-function relationships and as affinity
PT   tag to identify and isolate interacting proteins that bind to the factor.
XX
PS   Disclosure; Page 62; 73pp; English.
XX
CC   The present invention provides the protein and coding sequences of two
CC   human nuclear factors associated with dsRNA (NFAR-1 and NFAR-2). These
CC   are transcriptional regulators and are thought to play a role in
CC   apoptosis and tumourigenesis. The coding sequence (found on chromosome
CC   19p13.1-13.2) is useful as a probe to detect rearrangements in tumour
CC   cells and the protein is useful for determining structure-function
CC   relationships

PT   New isolated polynucleotide encoded by a phenotype-associated gene,
PT   useful for prognosticating statin therapy response, and diagnosing or
PT   treating cardiovascular diseases, such as hypertension, myocardial
PT   infarction and stroke.
XX
PS   Example 1; Page 74; 182pp; English.
XX
CC   The present invention relates to human phenotype-associated (PA) genes (I
CC   ; ADF13307-ADF13386) which contain a Single Nucleotide Polymorphism
CC   (SNP). The SNP is given in the sequence as a variant nucleotide. Also
CC   claimed are methods for screening for agents which regulate the activity
CC   of a PA gene and reagents that modulate the activity of a PA polypeptide
CC   or a polynucleotide where the reagent is identified by the screening
CC   methods. The methods and compositions of the present invention are useful
CC   for prognosticating, diagnosing and treating cardiovascular diseases,
CC   such as atherosclerosis, hypertension, restenosis, arterial inflammation,
CC   myocardial infarction and stroke. The present sequence is a PCR primer,
CC   used in the examples from the invention.

PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Disclosure; SEQ ID NO 10839; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO

PT   Pharmaceutical composition for treating asthma, has antisense
PT   oligonucleotide containing less percentage of adenosine, targeted to
PT   nucleic acids associated with lung airway or lung dysfunction, and
PT   bronchodilating agent.
XX
PS   Claim 15; SEQ ID NO 10839; 763pp; English.
XX
CC   This invention describes a novel composition (a) a first active agent,
CC   comprising oligonucleotides, effective for alleviating
CC   bronchoconstriction, respiratory tract inflammation, allergies and
CC   reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC   surfactant depletion or hyposecretion, when administered to a mammal. The
CC   oligonucleotides are derived from a gene encoding or regulating
CC   expression of a target polypeptide associated with lung airway or lung
CC   dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC   The invention also describes a kit, that comprises: (a) a delivery
CC   device, in separate containers, (b) the oligonucleotides, (c)
CC   instructions for adding a carrier and for use of the kit. The composition
CC   of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC   analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC   beta-adrenergic agonist. The composition is useful for preventing or
CC   treating a respiratory, lung or malignant disease. The administered
CC   composition comprises oligo and is administered to reduce the production
CC   or availability, or to increase the degradation of the target mRNA or to
CC   reduce the amount of target polypeptide present in the lungs. The
CC   pulmonary obstruction, and/or bronchoconstriction and/or lung
CC   inflammation, allergies and/or surfactant hypoproduction are associated
CC   with a disease or condition such as pulmonary vasoconstriction,
CC   inflammation, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC   transplantation rejection, pulmonary infections, bronchitis or cancer.
CC   The reduced adenosine content of the anti-sense oligos corresponding to
CC   thymidines present in the target RNA serves to prevent the breakdown of
CC   the oligonucleotides into products that free adenosine into the system
CC   e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC   prevent any unwanted effects due to it

PT   Oligomer hybridisable to HIV sequence and contg. peptide nucleic acid
PT   sub:unit - binds in complementary manner to DNA and RNA, and useful for
PT   modulating HIV viral activity, e.g. in treating AIDS.
XX
```

```
PS   Claim 2; Page 177; 186pp; English.
XX
CC   New peptide nucleic acid (PNA) oligomers are provided which (a) consist
CC   of naturally occurring nucleobases covalently bound to a polyamide
CC   backbone and (b) hybridise to the translation initiation AUG region, 5'
CC   untranslated region (5' UTR), 3' untranslated region (3' UTR), splice
CC   junctions or coding sequence of a human immunodeficiency virus gene
CC   chosen from env, gag, pol, rev and tat. The PNAs can be used to target
CC   RNA and single stranded DNA (ssDNA) to produce antisense-type gene
CC   regulation moieties. They have utility as gene-targetted drugs for
CC   modulating HIV processes. Hence they can be used to treat AIDS and other
CC   viral infections. They are also useful in diagnostic applications and as
CC   research tools. PNA oligomers have high affinity for complementary single
CC   stranded DNA. They are also able to form triple helices in which a first
CC   PNA strand binds with RNA or ssDNA and a second PNA strand binds with the
CC   resulting double helix or with the first PNA strand. The PNAs possess no
CC   significant charge and are water soluble, which facilitates cellular
CC   uptake. Further, since they contain amides of non-biological amino acids,
CC   they are biostable and resistant to enzymatic degradation by proteases.
CC   The present sequence is a specifically claimed PNA sequence (represented
CC   by the sequence of nucleobases) targetting the HIV gag/pol gene. (Updated
CC   on 25-MAR-2003 to correct PN field.)

XX
CC   The present invention describes nucleic acid molecules which modulate the
CC   synthesis, expression and/or stability of a mRNA encoding 1 or more
CC   receptors of vascular endothelial growth factor (VEGF). A patient
CC   (preferably human) having a condition associated with the level of the
CC   fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
CC   receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
CC   angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
CC   treated by administering the nucleic acid molecule or the expression
CC   vector to the patient. AAX67275 to AAX75752 represent specific examples
CC   of nucleic acid molecules from the present invention

CC   A method has been developed for detecting the presence or absence of a
CC   single nucleotide polymorphism (SNP) allele in a genomic sample. The
CC   method comprises preparing a reduced complexity genome (RCG) from the
CC   genomic sample and analysing the RCG for the presence or absence of a SNP
CC   allele. The method can be used to characterise a tumour, to generate a
CC   genomic pattern for an individual genome or to generate a genomic
CC   classification code for a genome. The method can be used to assess
CC   whether a subject is at risk for developing a disease or to identify a
CC   set of SNP alleles associated with a disease. The method can also be used
CC   to perform linkage analysis. AAA35944 to AAA35947 represent sequences
CC   used in the exemplification of the present invention. AAA35948 to
CC   AAA36632 represent nucleotide sequences containing SNPs

PT   Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
PT   constructs, which down regulate expression of a CD20 gene or neurite
PT   growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
PT   central nervous system injury.
XX
PS   Claim 88; Page 95; 200pp; English.
XX
CC   The invention relates to a nucleic acid molecule which down regulates
CC   expression of a CD20 gene and a nucleic acid molecule which down
CC   regulates expression of a neurite growth inhibitor gene (NOGO). The
CC   nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
CC   DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule
CC   possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr
CC   an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
CC   with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA
CC   of CD20 in the presence of a divalent cation that is preferably Mg^2^+.
CC   Furthermore, it may be contacted with a cell to reduce CD20 activity of
CC   the cell and treat a patient having a condition associated with the level
CC   of CD20. The treatment may further comprise the use of one or more
CC   therapies. In particular, the CD20 targetting nucleic acid may be used to
CC   treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
CC   Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
CC   leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
CC   lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
CC   immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-
CC   targetting nucleic acid is used to cleave RNA of the NOGO gene in the
CC   presence of a divalent cation that is preferably Mg^2^+. Furthermore, the
CC   nucleic acid may be contacted with a cell to reduce NOGO activity of the
CC   cell and treat a patient having a condition associated with the level of
CC   NOGO. The treatment may further comprise the use of one or more
CC   therapies. In particular, the NOGO-targetting nucleic acid may be used to
CC   treat central nervous system (CNS) injury and cerebrovascular accident
CC   (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
CC   chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
CC   Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
CC   disease, muscular dystrophy, and/or other neurodegenerative disease
CC   states which respond to the modulation of NOGO expression. The present
CC   sequence is a zinzyme molecule of the invention

PT   Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
PT   constructs, which down regulate expression of a CD20 gene or neurite
PT   growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
PT   central nervous system injury.
XX
PS   Claim 88; Page 116; 200pp; English.
XX
CC   The invention relates to a nucleic acid molecule which down regulates
CC   expression of a CD20 gene and a nucleic acid molecule which down
CC   regulates expression of a neurite growth inhibitor gene (NOGO). The
CC   nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
CC   DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule
CC   possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr
CC   an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
CC   with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA
CC   of CD20 in the presence of a divalent cation that is preferably Mg^2^+.
CC   Furthermore, it may be contacted with a cell to reduce CD20 activity of
CC   the cell and treat a patient having a condition associated with the level
CC   of CD20. The treatment may further comprise the use of one or more
CC   therapies. In particular, the CD20 targetting nucleic acid may be used to
CC   treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
CC   Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
CC   leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
CC   lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
CC   immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-
CC   targetting nucleic acid is used to cleave RNA of the NOGO gene in the
CC   presence of a divalent cation that is preferably Mg^2^+. Furthermore, the
CC   nucleic acid may be contacted with a cell to reduce NOGO activity of the
CC   cell and treat a patient having a condition associated with the level of
CC   NOGO. The treatment may further comprise the use of one or more
CC   therapies. In particular, the NOGO-targetting nucleic acid may be used to
CC   treat central nervous system (CNS) injury and cerebrovascular accident
CC   (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
CC   chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
CC   Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
CC   disease, muscular dystrophy, and/or other neurodegenerative disease
CC   states which respond to the modulation of NOGO expression. The present
CC   sequence is a DNAzyme molecule of the invention

XX
CC The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC nucleic acids can be used as probes to detect, characterise and quantify
CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC provide initial substrates for the recombinant engineering of hGDMLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMLP
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption ionisation, as
CC therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMLP-1, in particular heart
CC and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMLP-1 sequence in the exemplification of the present invention. N.B.
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO

CC   1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC   nucleic acids can be used as probes to detect, characterise and quantify
CC   hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC   provide initial substrates for the recombinant engineering of hGDMLP-1
CC   protein variants having desired phenotypic improvements, and for
CC   expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC   used as immunogens to raise antibodies that specifically recognise hGDMLP
CC   -1 proteins, as standards in assays used to determine the concentration
CC   and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC   capture probes for surface-enhanced laser desorption ionisation, as
CC   therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC   production, and in vaccines or for replacement therapy. The
CC   polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC   disorder associated with the expression of hGDMLP-1, in particular heart
CC   and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC   The present sequence represents an oligomer used in the screening of the
CC   hGDMLP-1 sequence in the exemplification of the present invention. N.B.
CC   The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO

XX
CC   The invention relates to nucleic acid molecules that modulate replication
CC   of the West Nile Virus (WNV). The nucleic acid molecules are useful for
CC   treating a condition related to WNV infection e.g. pancreatitis,
CC   encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
CC   liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
CC   molecule is selected from the group of ribozymes consisting of
CC   Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The
CC   nucleic acid molecules further comprise at least five ribose residues, at
CC   least ten 2'-O-methyl modifications, phosphorothioate linkages on at
CC   least three of the 5' terminal nucleotides and a 3' end modification of a
CC   3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
CC   are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
CC   in the specification. The present sequence is that of a nucleic acid
CC   molecule of the invention

PT   New nucleic acid molecule that modulates replication of West Nile Virus
PT   (WNV), useful for treating a condition related to WNV infection e.g.
PT   pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
XX
PS   Claim 23; SEQ ID NO 9112; 495pp; English.
XX
CC   The invention relates to nucleic acid molecules that modulate replication
CC   of the West Nile Virus (WNV). The nucleic acid molecules are useful for
CC   treating a condition related to WNV infection e.g. pancreatitis,
CC   encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
CC   liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
CC   molecule is selected from the group of ribozymes consisting of
CC   Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The
CC   nucleic acid molecules further comprise at least five ribose residues, at
CC   least ten 2'-O-methyl modifications, phosphorothioate linkages on at
CC   least three of the 5' terminal nucleotides and a 3' end modification of a
CC   3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
CC   are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
CC   in the specification. The present sequence is that of a nucleic acid
CC   molecule of the invention

PT   with tumors and cell degeneration, also related polypeptides, antibodies
PT   and transfected cells.
XX
PS   Disclosure; Page 122; 720pp; French.
XX
CC   The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC   given in the specification, a sequence containing at least 15 consecutive
CC   nucleotides from the 17 mer sequence, a sequence with, after optimal
CC   alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC   hybridizes to them under highly stringent conditions, or the complement
CC   of any of them, or the corresponding RNA. The novel isolated nucleic
CC   acids of the invention are useful as probes and primers for detecting,
CC   identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC   component of a gene chip, in vitro as (anti)sense reagents, and for
CC   production of recombinant polypeptides. Any of the nucleic acids,
CC   polypeptides, vectors containing the nucleic acids, cells containing the
CC   vector or antibodies directed against the polypeptides are useful for
CC   preparation of pharmaceuticals for prevention and/or treatment of viral
CC   diseases that are characterised by development of tumours or cell
CC   degeneration, specifically cancer but also Alzheimer's disease and
CC   schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC   patient samples is useful for diagnosis and/or prognosis of these
CC   diseases. The polypeptides can also be used to generate antibodies, and
CC   both the polypeptide and antibodies are useful as components of protein
CC   chips. The nucleic acid sequences of the invention can be used in gene
CC   therapy. This polynucleotide sequence represents a tumour suppression
CC   related human fukutin oligonucleotide of the invention

XX
CC   The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC   given in the specification, a sequence containing at least 15 consecutive
CC   nucleotides from the 17 mer sequence, a sequence with, after optimal
CC   alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC   hybridizes to them under highly stringent conditions, or the complement
CC   of any of them, or the corresponding RNA. The novel isolated nucleic
CC   acids of the invention are useful as probes and primers for detecting,
CC   identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC   component of a gene chip, in vitro as (anti)sense reagents, and for
CC   production of recombinant polypeptides. Any of the nucleic acids,
CC   polypeptides, vectors containing the nucleic acids, cells containing the
CC   vector or antibodies directed against the polypeptides are useful for
CC   preparation of pharmaceuticals for prevention and/or treatment of viral
CC   diseases that are characterised by development of tumours or cell
CC   degeneration, specifically cancer but also Alzheimer's disease and
CC   schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC   patient samples is useful for diagnosis and/or prognosis of these
CC   diseases. The polypeptides can also be used to generate antibodies, and
CC   both the polypeptide and antibodies are useful as components of protein
CC   chips. The nucleic acid sequences of the invention can be used in gene
CC   therapy. This polynucleotide sequence represents a tumour suppression
CC   related human fukutin oligonucleotide of the invention

XX
CC   The present invention relates to nucleic acid molecules which modulate
CC   the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC   Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC   and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,
CC   inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
CC   are nucleic acid decoy molecules and aptamers that bind to HBV reverse
CC   transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC   as oligonucleotides that specifically bind the Enhancer I region of HBV
CC   DNA. The nucleic acids may be used to modulate the expression of HBV
CC   genes and HBV viral replication. Also disclosed is a method for screening
CC   compounds and/or potential therapies directed against HBV, and compounds
CC   that modulate the expression and/or replication of HCV. The compounds and
CC   methods of the invention are useful for the treatment of degenerative and
CC   disease states related to HBV and HCV infection, replication and gene
CC   expression such as cirrhosis, liver failure, and hepatocellular
CC   carcinoma. The present sequence represents a substrate for one of the HBV
CC   ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences
CC   disclosed in the present invention

CC   The present invention relates to nucleic acid molecules which modulate
CC   the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC   Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC   and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,
CC   inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
CC   are nucleic acid decoy molecules and aptamers that bind to HBV reverse
CC   transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC   as oligonucleotides that specifically bind the Enhancer I region of HBV
CC   DNA. The nucleic acids may be used to modulate the expression of HBV
CC   genes and HBV viral replication. Also disclosed is a method for screening
CC   compounds and/or potential therapies directed against HBV, and compounds
CC   that modulate the expression and/or replication of HCV. The compounds and
CC   methods of the invention are useful for the treatment of degenerative and
CC   disease states related to HBV and HCV infection, replication and gene
CC   expression such as cirrhosis, liver failure, and hepatocellular
CC   carcinoma. The present sequence represents a substrate for one of the HBV
CC   ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences
CC   disclosed in the present invention

PS   Example 1; Page 144; 387pp; English.
XX
CC   The present invention relates to nucleic acid molecules which modulate
CC   the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC   Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC   and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,
CC   inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
CC   are nucleic acid decoy molecules and aptamers that bind to HBV reverse
CC   transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC   as oligonucleotides that specifically bind the Enhancer I region of HBV
CC   DNA. The nucleic acids may be used to modulate the expression of HBV
CC   genes and HBV viral replication. Also disclosed is a method for screening
CC   compounds and/or potential therapies directed against HBV, and compounds
CC   that modulate the expression and/or replication of HCV. The compounds and
CC   methods of the invention are useful for the treatment of degenerative and
CC   disease states related to HBV and HCV infection, replication and gene
CC   expression such as cirrhosis, liver failure, and hepatocellular
CC   carcinoma. The present sequence represents a substrate for one of the HBV
CC   ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences
CC   disclosed in the present invention

XX
CC The invention relates to the isolation of 6327 nucleotide sequences,
CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC sequence having at least 80% identity, after optimal alignment, with the
CC nucleotides, a sequence that hybridizes under stringent conditions with
CC the nucleotides, or the complement, or corresponding RNA, of the
CC nucleotides. The nucleotides are used as probes or primers for detecting,
CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC sense and antisense sequences, of nucleotides involved in tumour
CC suppression or reversion, apoptosis and or viral resistance, to produce
CC recombinant polypeptides, and to prepare transgenic animals, as
CC experimental models. The nucleotides (also vectors containing them and
CC cells containing the vectors), the encoded polypeptides and antibodies
CC (Ab) against the polypeptide are useful for prevention and/or treatment
CC of viral infections or diseases characterized by development of tumours
CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC Analysis of the expression of the nucleotides can be used for diagnosis
CC and/or prognosis of these diseases. The nucleotides and polypeptides can
CC also be used to screen for their specific interactive molecules,
CC potentially useful for treating diseases associated with abnormal
CC expression of the nucleotides.

PT   New isolated nucleic acid, useful for treating viral diseases associated
PT   with tumors and cell degeneration, also related polypeptides, antibodies
PT   and transfected cells.
XX
PS   Disclosure; SEQ ID NO 2781; 30pp; French.
XX
CC   This invention relates to novel isolated nucleic acid sequences involved
CC   in the phenomena of tumour suppression, tumour reversion, apoptosis
CC   and/or resistance to viruses. The invention may be useful for the
CC   development of compounds with a cytostatic, virucide, neuroprotective,
CC   nootropic or neuroleptic activity. The DNA sequences may be useful as
CC   probes and primers for detecting, indentifying, quantifying and/or
CC   amplifying nucleic acid, for example as one component of a gene chip, in
CC   vitro as antisense reagents and for production of recombinant
CC   polypeptides. The invention may therefore be useful for preparation of
CC   pharmaceuticals for prevention and/or treatment of viral diseases that
CC   are characterised by development of tumours or cell degeneration,
CC   specifically cancer but also Alzheimer's disease and schizophrenia. The
CC   present sequence is that of a nucleic acid sequence of the invention.
CC   Note: The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/publishedpct_sequences

PT   New isolated nucleic acid, useful for treating viral diseases associated
PT   with tumors and cell degeneration, also related polypeptides, antibodies
PT   and transfected cells.
XX
PS   Disclosure; SEQ ID NO 5274; 30pp; French.
XX
CC   This invention relates to novel isolated nucleic acid sequences involved
CC   in the phenomena of tumour suppression, tumour reversion, apoptosis
CC   and/or resistance to viruses. The invention may be useful for the
CC   development of compounds with a cytostatic, virucide, neuroprotective,
CC   nootropic or neuroleptic activity. The DNA sequences may be useful as
CC   probes and primers for detecting, indentifying, quantifying and/or
CC   amplifying nucleic acid, for example as one component of a gene chip, in
CC   vitro as antisense reagents and for production of recombinant
CC   polypeptides. The invention may therefore be useful for preparation of
CC   pharmaceuticals for prevention and/or treatment of viral diseases that
CC   are characterised by development of tumours or cell degeneration,
CC   specifically cancer but also Alzheimer's disease and schizophrenia. The
CC   present sequence is that of a nucleic acid sequence of the invention.
CC   Note: The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/publishedpct_sequences

PT   Novel enzymatic nucleic acid that down-regulates expression of neurite
PT   growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
PT   protein kinase PKR genes, for treating cancer and inflammatory disease.
XX
PS   Claim 59; SEQ ID NO 2869; 317pp; English.
XX
CC   The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC   that down regulate the expression or inhibit the function of a receptor
CC   for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC   IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC   invention are useful for treating: cerebrovascular accident, central
CC   nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC   lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC   restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC   disease, lupus, multiple sclerosis, transplant/graft rejection,
CC   ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC   conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC   nucleic acids of the invention are also useful for down-regulating the
CC   expression of a target gene and as a diagnostic tool to examine genetic
CC   drifts and mutations within diseased cells or to detect the presence of a
CC   target RNA in a cell. The present RNA sequence represents a human PKR
CC   substrate sequence.

XX
PT   Novel enzymatic nucleic acid that down-regulates expression of neurite
PT   growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
PT   protein kinase PKR genes, for treating cancer and inflammatory disease.
XX
PS   Claim 161; SEQ ID NO 4577; 317pp; English.
XX
CC   The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC   that down regulate the expression or inhibit the function of a receptor
CC   for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC   IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC   invention are useful for treating: cerebrovascular accident, central
CC   nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC   lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC   restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC   disease, lupus, multiple sclerosis, transplant/graft rejection,
CC   ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC   conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC   nucleic acids of the invention are also useful for down-regulating the
CC   expression of a target gene and as a diagnostic tool to examine genetic
CC   drifts and mutations within diseased cells or to detect the presence of a
CC   target RNA in a cell. The present RNA sequence represents a human PKR
CC   substrate sequence.

XX
PT   Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes
PT   specifically cleaving RNA derived from hepatitis B virus and comprising
PT   one or more binding arms, useful for treating hepatitis and cirrhosis.
XX
PS   Disclosure; SEQ ID NO 1704; 122pp; English.
XX
CC   The invention relates to an enzymatic nucleic acid molecule that
CC   specifically cleaves RNA derived from hepatitis B virus (HBV) and
CC   comprising one or more binding arms, without requiring the presence of a
CC   2'-OH group within the molecule for activity. The nucleic acids are
CC   useful for treating hepatitis B virus infection, hepatitis,
CC   hepatocellular carcinoma, cirrhosis and liver failure, either alone or in
CC   combination with other therapies such as lamivudine and interferons. The
CC   nucleic acids are useful as diagnostic tools to examine genetic drift and
CC   mutations within diseased cells, for detecting the presence of HBV RNA in
CC   a cell, for the study of RNA and for down-regulating gene expression of
CC   target genes in bacterial, fungal, viral, plant or mammalian cells. This
CC   sequence represents an HBV RNA target sequence, used in the scope of the
CC   invention. Note: The sequence data for this patent is also available in
CC   electronic format from USPTO at seqdata.uspto.gov/sequence.html.

PT   Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes
PT   specifically cleaving RNA derived from hepatitis B virus and comprising
PT   one or more binding arms, useful for treating hepatitis and cirrhosis.
XX
PS   Disclosure; SEQ ID NO 938; 122pp; English.
XX
CC   The invention relates to an enzymatic nucleic acid molecule that
CC   specifically cleaves RNA derived from hepatitis B virus (HBV) and
CC   comprising one or more binding arms, without requiring the presence of a
CC   2'-OH group within the molecule for activity. The nucleic acids are
CC   useful for treating hepatitis B virus infection, hepatitis,
CC   hepatocellular carcinoma, cirrhosis and liver failure, either alone or in
CC   combination with other therapies such as lamivudine and interferons. The
CC   nucleic acids are useful as diagnostic tools to examine genetic drift and
CC   mutations within diseased cells, for detecting the presence of HBV RNA in
CC   a cell, for the study of RNA and for down-regulating gene expression of
CC   target genes in bacterial, fungal, viral, plant or mammalian cells. This
CC   sequence represents an HBV RNA target sequence, used in the scope of the
CC   invention. Note: The sequence data for this patent is also available in
CC   electronic format from USPTO at seqdata.uspto.gov/sequence.html.

PT   Detecting polymorphisms linked to a gene associated with familial
PT   dysautonomia.
XX
PS   Claim 8; Col 43-44; 33pp; English.
XX
CC   This invention describes a novel method for detecting the presence in a
CC   subject of a polymorphism linked to a gene associated with familial
CC   dysautonomia comprising analyzing human chromosome 9. The method
CC   comprises analyzing human chromosome 9 for the presence of a polymorphism
CC   located between D9S53 and D9S105 inclusive and linked to the gene
CC   associated with familial dysautonomia where the presence of a
CC   polymorphism is indicative of carriers of a gene associated with familial
CC   dysautonomia. The methods allow characterization of simple sequence
CC   repeat polymorphisms using less DNA, typically only 10 nanograms of
CC   genomic DNA, and is faster than restriction fragment length polymorphism
CC   analysis. AAZ43609-Z43642 represent PCR primers used in the detection
CC   method described in the method of the invention

PT   New antisense compound that inhibits human Smad2, useful e.g. for
PT   treating or preventing infection, inflammation and tumors.
XX
PS   Claim 11; Col 39; 31pp; English.
XX
CC   This sequence represents an antisense nucleotide sequence targeting human
CC   Smad2. Smad2 is also known as MADH2, MADR2, hMAD2 and JV18-1, and is a
CC   member of a subgroup of Smad family transcription factors which are
CC   cytosolic proteins regulated by transforming growth factor-beta (TGF-
CC   beta) and activins. Smads exist as monomers in unstimulated cells as homo
CC   - or heterodimerise and translocate to the nucleus and activate target
CC   gene transcription upon ligand binding. The Smad2 gene is located on
CC   chromosome 18q21. The invention relates to antisense compounds (see
CC   AAA10548-A10587) targeted to the Smad2 nucleotide sequence. The antisense
CC   oligonucleotide sequences inhibit Smad2 expression by hybridising to DNA
CC   or RNA. The antisense nucleotides are used to treat or prevent diseases
CC   associated with expression of Smad2, e.g. infection, inflammation and
CC   tumours. The oligonucleotides can also be used as diagnostic or research
CC   reagents
